

## **Summary of first lecture**

<http://gis.unbc.ca>

- **Most disciplines use maps /geomatics**
- **Maps help you see the world**
- **Mapping is a practical skill for jobs**
- **Map creation is ever increasing**
- **The Power of Maps (graphics)**
  - – see example next slide

# BOMB SIGHT

Mapping the WW2 bomb census

## EXPLORE THE LONDON BLITZ during 7th October 1940 to 6th June 1941

Type Street, Location ...

Aggregate Bomb Census ▾

Information

# Cartography and Geomatics

- **Cartography:** The art, science and technology of making maps
- **Geomatics:** An umbrella term for the mapping technologies
- **Map:** A (two-dimensional) scaled representation of a planetary surface ('traditional' definition)
  - includes printed maps, online displays, animations

# Cartography versus GIS in the Geomatics umbrella

## Cartography

Input -> **map design** -> Output

## GIS

Input -> **Database** -> **Analysis** -> Output

# Map Basics - summary

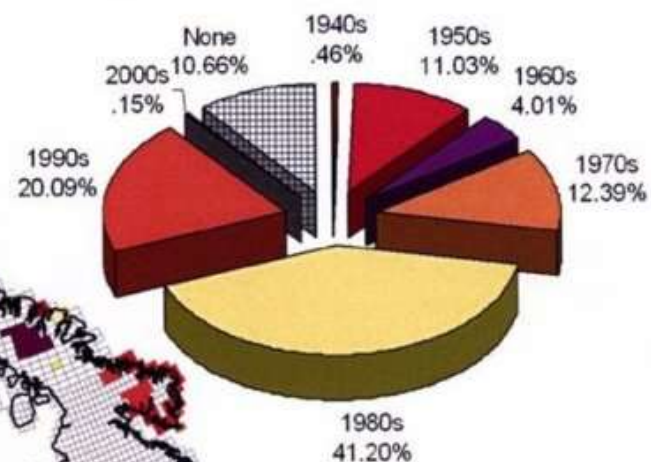

- The nature of mapping
- Types of maps (/ data)
- Uses of maps (/ data)
- Map and data layers
- Map Scales

# The nature of mapping:

## 1a. Mapping is never finished (especially here)

NTS maps  
1:50,000

Map sheets: 13377

Average: 1986

Oldest: 1944

Area: 9,988,029 sq km

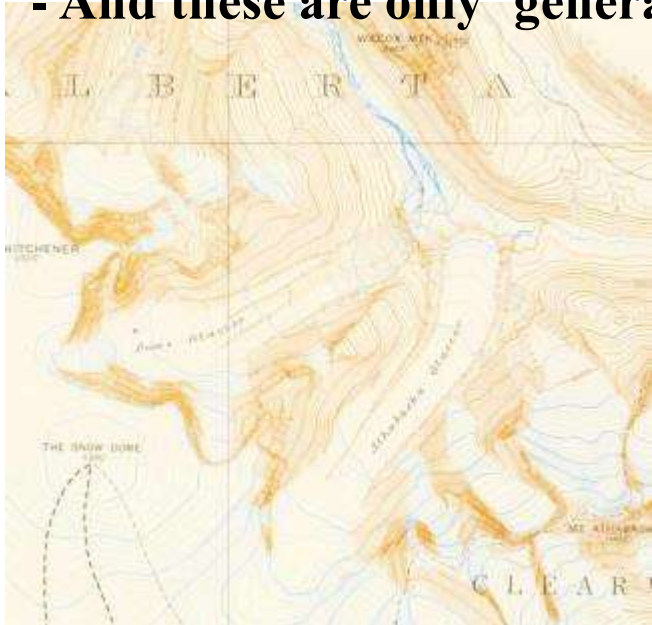

BC: 1168 map sheets

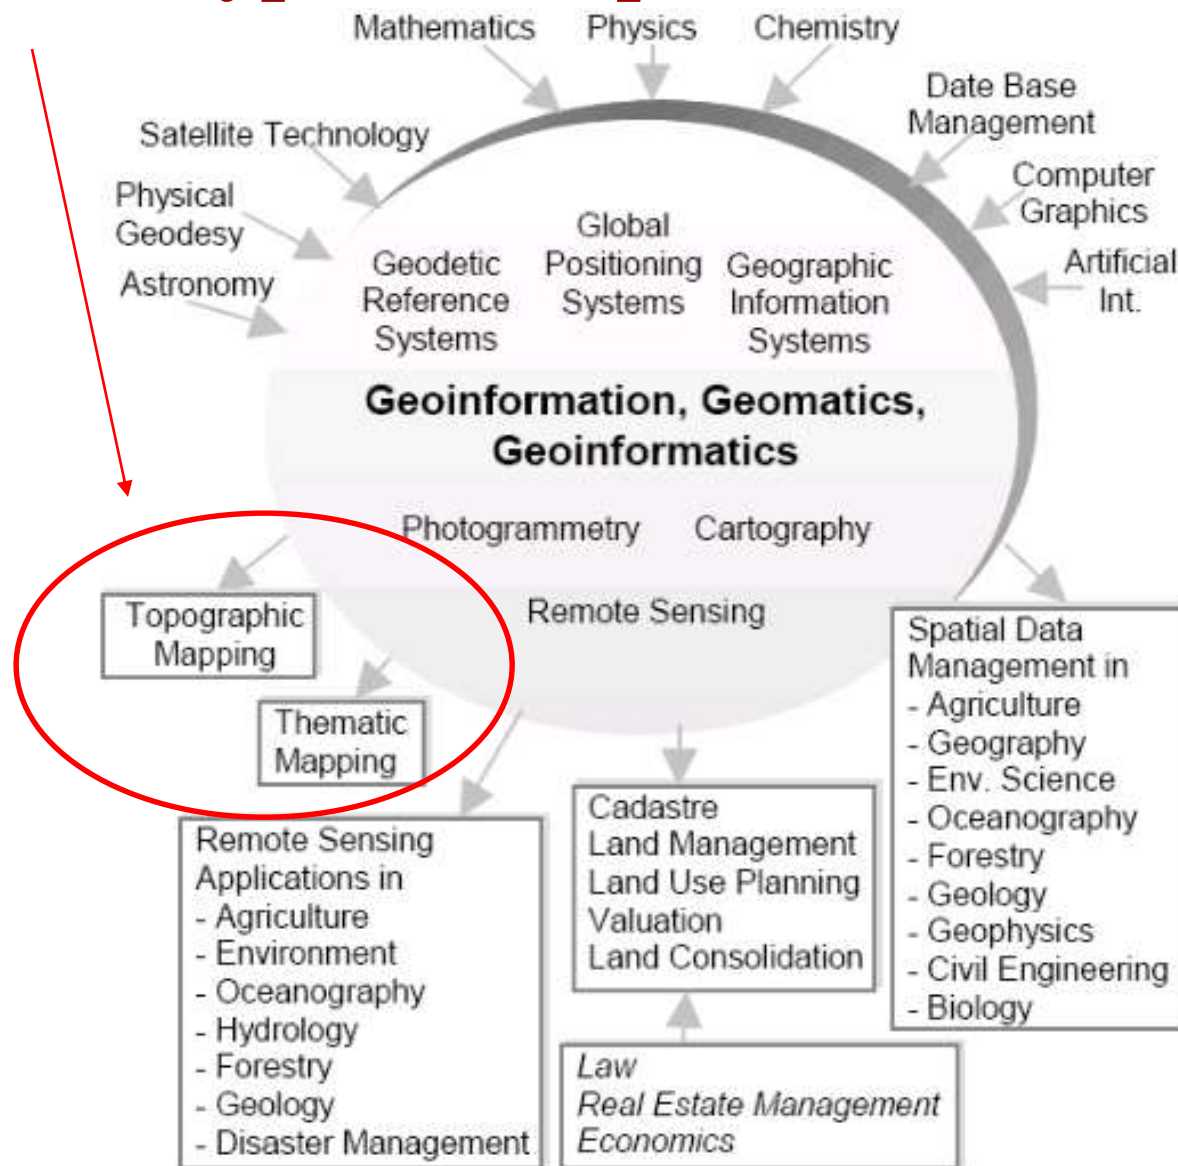

# 1b. There are multiple map products for the same area

- And these are only 'general' examples

## 2. Types of Maps and data

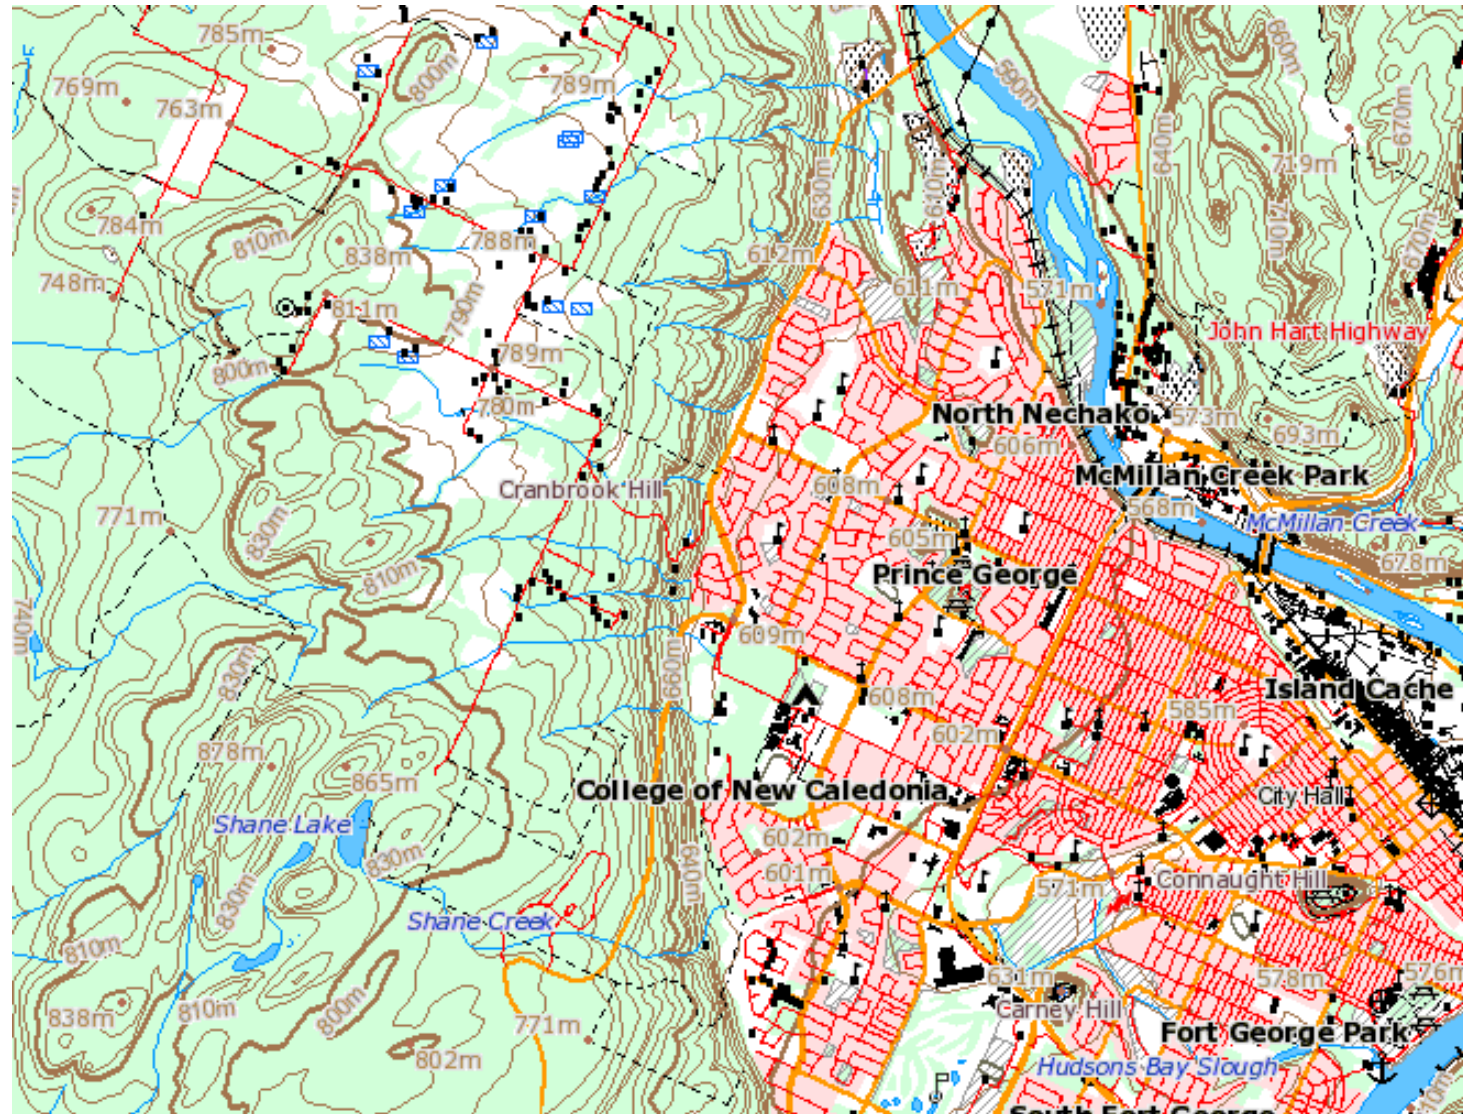

**Figure 1.** Geomatics (After Konecny, 2002)

**a. General purpose (topographic) - 'base layers'**

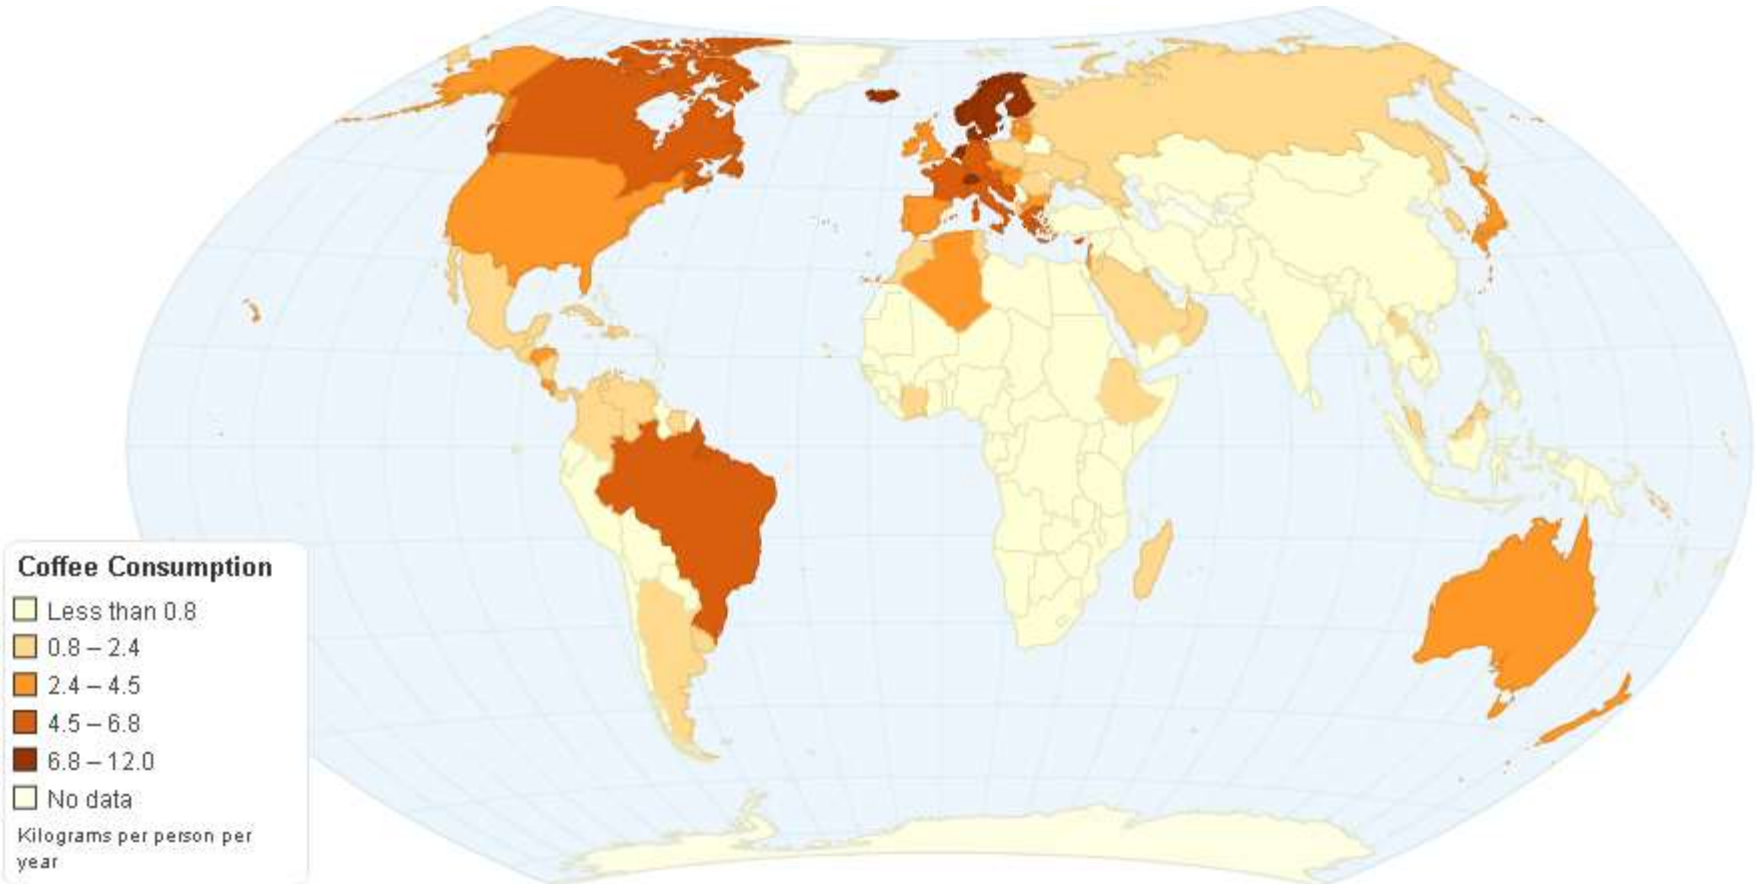

These show the **visible features of the landscape** e.g. relief, water, and roads  
- base maps, relief maps, city maps (and nautical charts)

## b. Special purpose (thematic)

Emphasis is placed on a particular element

e.g. climate, geology, population density, industry.

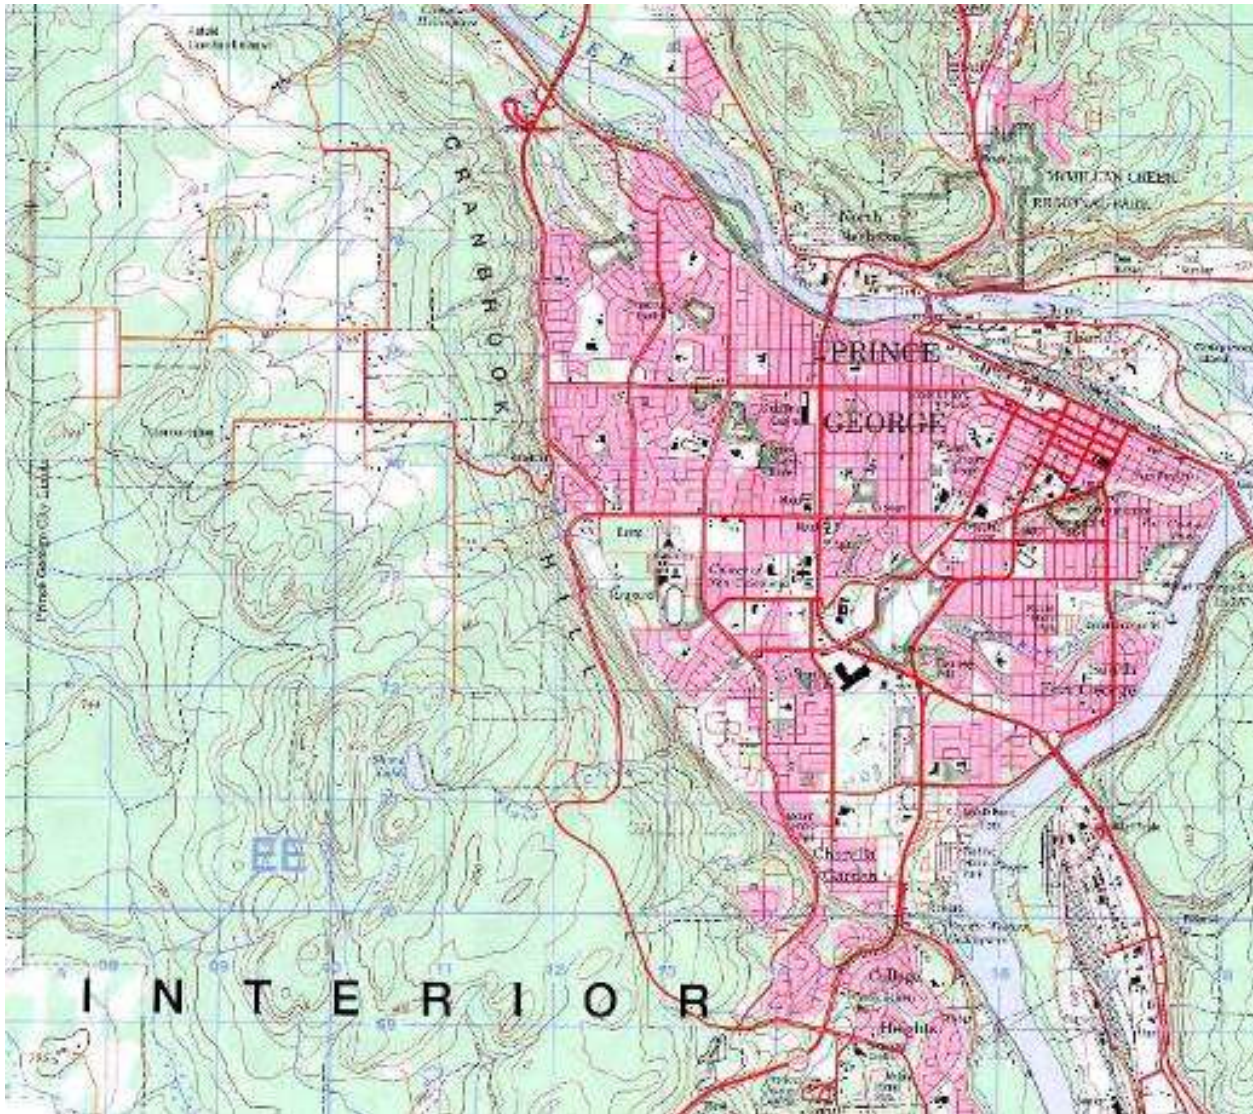

# Global coffee consumption

Canada: #12

### 3. Purpose of Maps / spatial data

#### A. Display and store of spatial information (space)

## B. Historical record of spatial features (time)

## B. Historical record of spatial features (time)

# Purpose of Maps & Spatial data

- A. Display and store of spatial information
- B. Historical record of spatial features

Kakwa Park, BC 1920

2010 (Google maps)

Long term history: <https://www.old-maps.co.uk>

# Purpose of maps: C. Communication tool

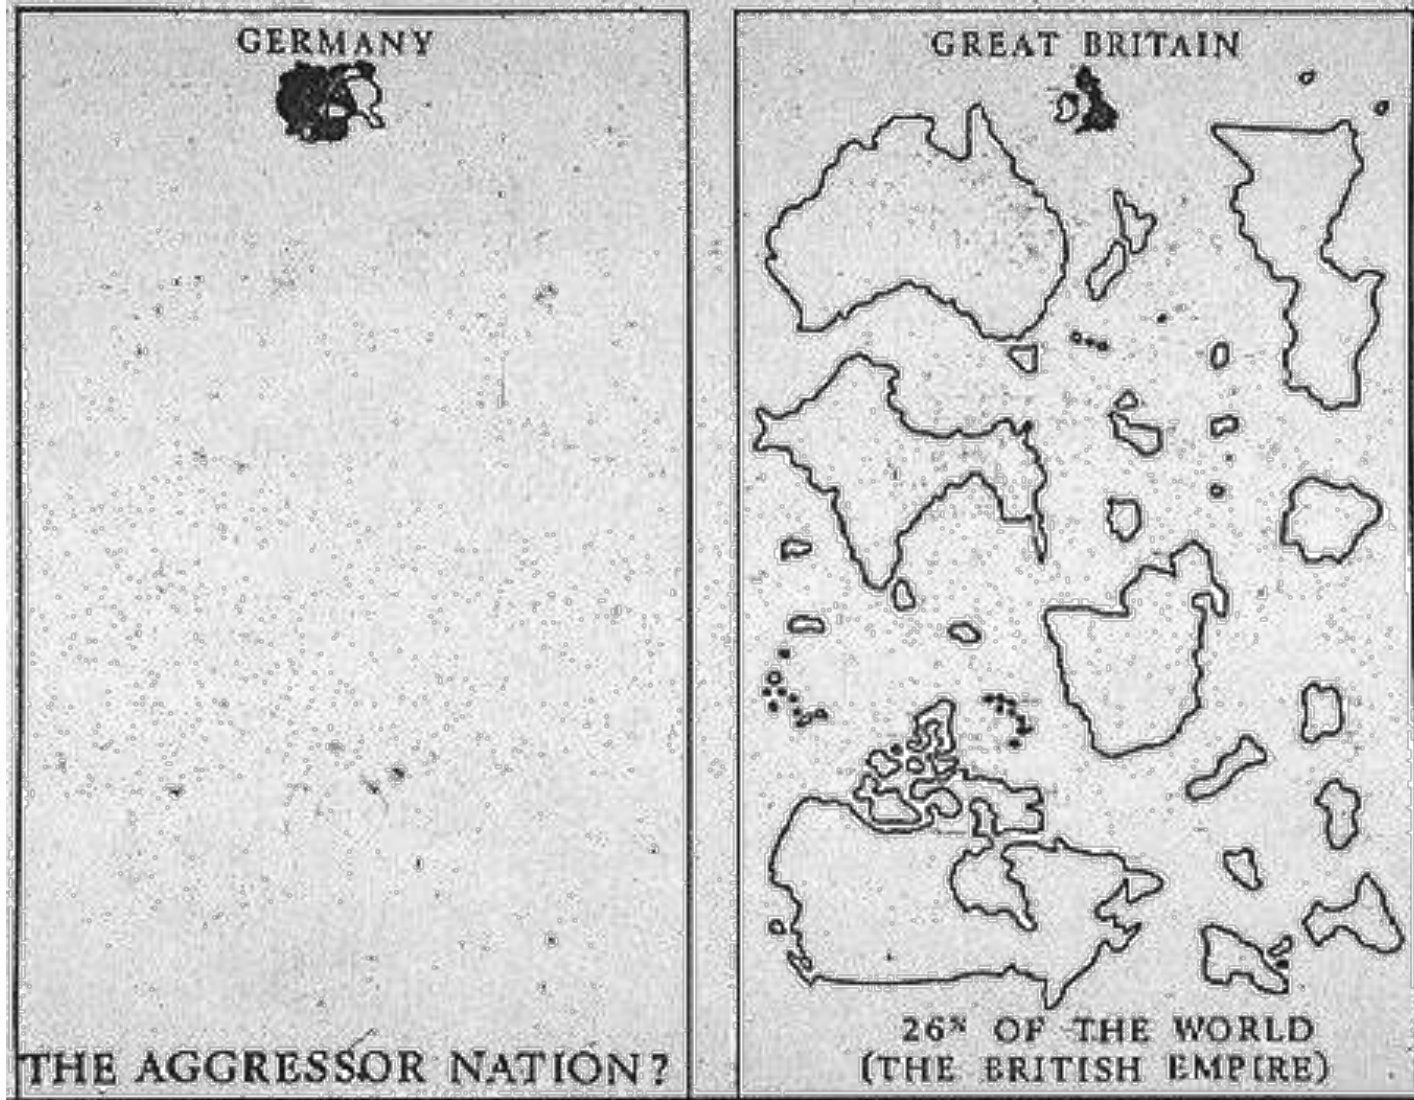

What is the red line at  $\sim 46^{\circ}\text{N}$  ?

# General Uses of Maps & Spatial data

C: Communication tool e.g. propaganda

German map, world war II

*Enbridge image to show supertanker safety by omitting islands*

**Critical Cartography**  
.. differs from academic cartography in that it links geographic knowledge with political power.

Image above adjusted to include representations of the islands that lie within the waterway (islands added by Lori Waters)

# Communication propaganda: Promoting BC during the Gold Rush, 1858

# Communication (humour): How Donald sees the world

# D. Maps as works of art

<http://www.antonthomasart.co>

<https://www.youtube.com/watch?v=B20WKWnDmRQ>

<https://www.youtube.com/watch?v=4HpmWkBCFOE>

# Maps as works of art

Maps of Whistler Blackcomb, Grouse Mountain and Sun Peaks among James Niehues many paintings.

CBC News - Posted: Mar 31, 2019 6:00 PM PT | Last Updated: March 31, 2019

<https://www.outsideonline.com/2376261/man-behind-ski-maps>

# E. 'Vicarious' travel - and work of art

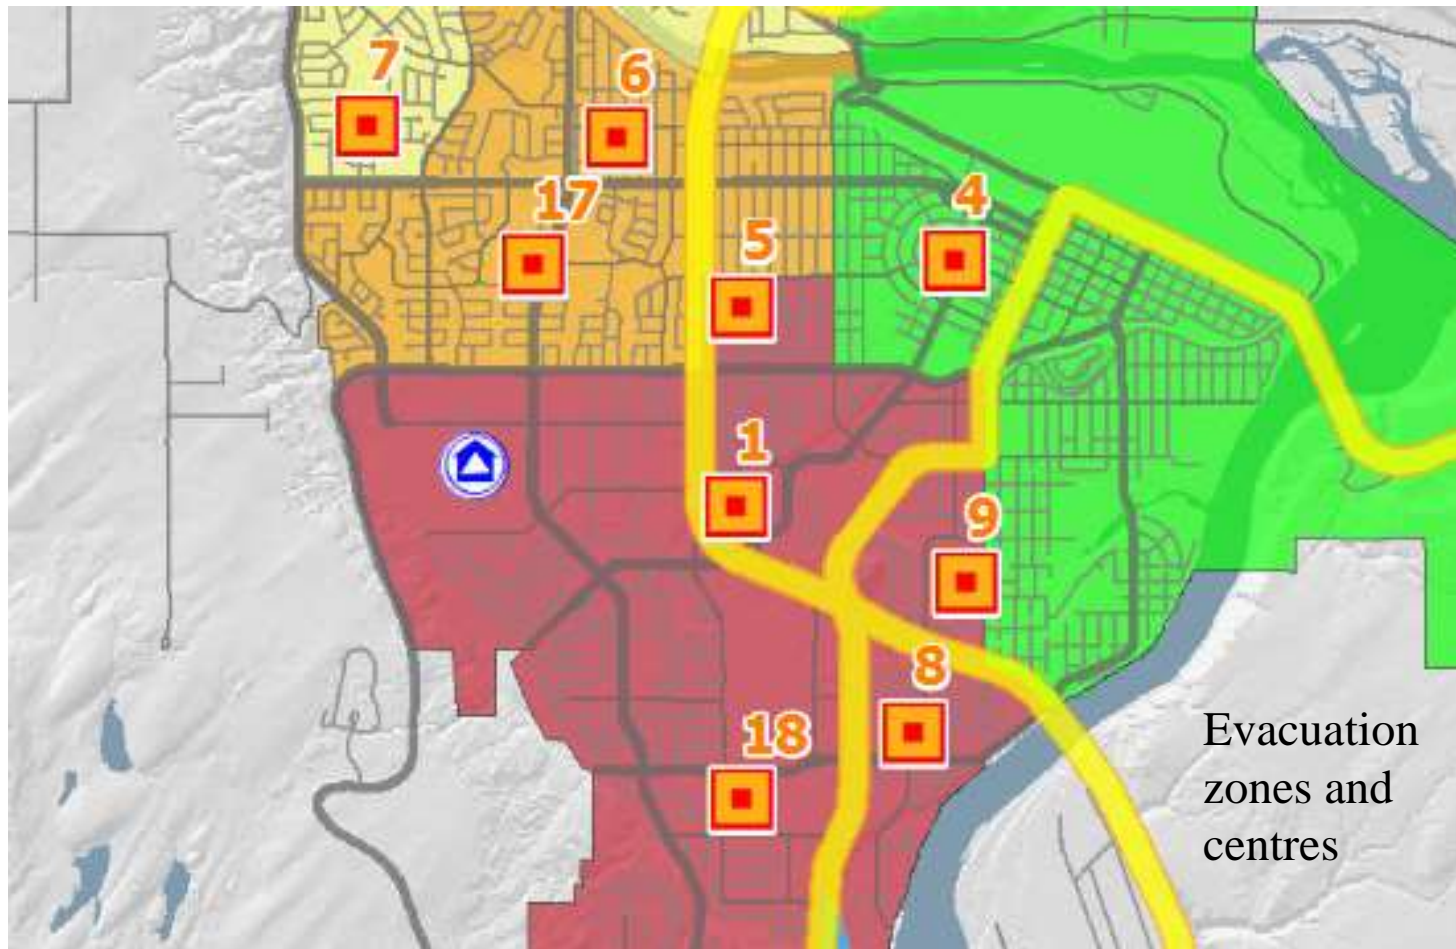

## 4. Map and data layers

Maps and datasets are composed of layers or themes -  
'feature' types are organised in **layers** e.g. roads, rivers etc..

There are three (vector) types: **points**, **lines** and **areas** (polygons-GIS)

# Raster (grid) layers

In addition to the 3 'feature' types, there are continuous grids (rasters) e.g. for air photos, images, relief models

pixels

# 5. Map Scales

**The concept of scale is fundamental to mapping ...**

*Scale represents the reduction compared to the distances on the earth's surface.*

Without a scale, it is a 'diagram', (not a map)

Scale can be given in 3 ways:

## a. Verbal statement

- For example, 1 cm to 10 km, 1 inch to 1 mile
- Verbal statements are simple to understand
- They are 'unit-dependent'

## b. Ratio or 'representative fraction (RF)'

- This states the reduction as a fraction or ratio  
e.g. 1:100,000 or 1/100,000
- It is free of specific units (metric or imperial)
- It can describe map series and datasets e.g. 1:50,000
- 1:20,000 is a larger scale than 1:50,000 (reduced less)  
(1/20,000 IS bigger than 1/50,000)

## c. Scale bar

- **Graphic**, units are stated e.g. kilometres or miles
- Scale bar adapts in size with zoom to match display

‘Classic’ traditional scale bars

# common world scales / map series / data

1:1,000,000 (world)

Small

1:500,000

-----

1:250,000

Medium

(1:125,000)

-----

1:50,000 (federal)

Large

1:20,000 (provincial)

-----

>1:10,000 (municipal)

Cadastral

# **common world scales / imperial series**

Canada converted to metric post world war II

**1: 506,880      1" = 8 miles    -> 1:500,000**

-----

**1: 253,440      1" = 4 miles    -> 1:250,000**

**1: 126,720      1" = 2 miles    -> 1:125,000**

-----

**1: 63,360      1" = 1 mile      -> 1:50,000**

The world is metric except for Liberia, Myanmar and USA

# Conversion between a ratio and a statement

To convert **1:250,000** to be a statement:

$$1 \text{ cm to } 250,000 \text{ cm} = 2500\text{m} = 2.5 \text{ km}$$

Scale is 1 cm to 2.5 km

In reverse: *Get each side of the scale into the same units,*  
for example:

To convert **1 cm to 1 km** into a ratio:

$$1 \text{ km} = 1000\text{m} = 100,000 \text{ cm}$$

So 1cm to 1km is the same as 1:100,000
