Remote sensing of the planets

A vast literature and methodology exists in optical and radar astronomy that parallels and often exceeds our methods used in remote sensing

Space – the final RS frontier

Welcome to the Planets™

Methods and wavelengths used on planetary missions

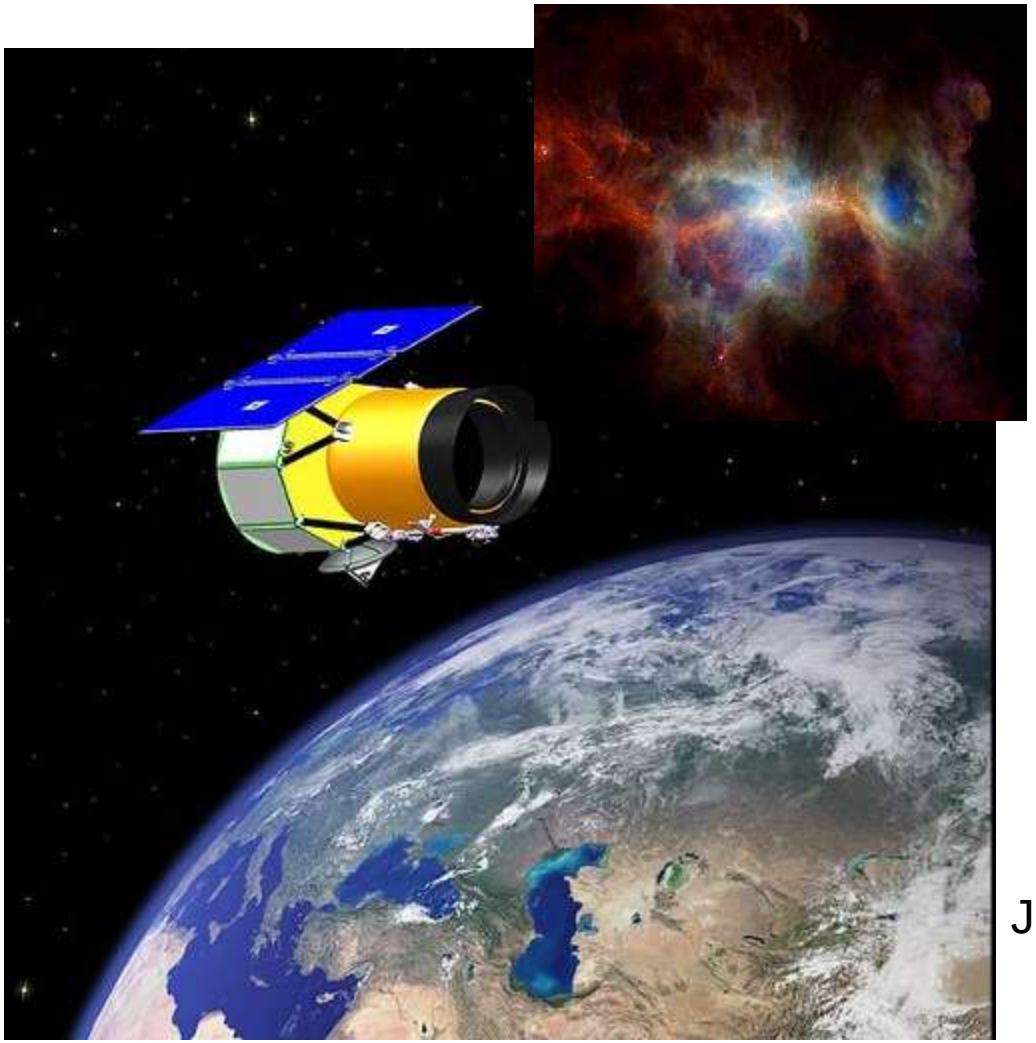
METHOD	EM SPECTRUM	INFORMATION	INTERPRETATION	MISSION
Gamma-Ray Spectroscopy	Gamma rays	Gamma spectrum	K, U, Th Abundances	Apollo 15, 16: Venera
X-ray Fluorescence spectrometry	X-rays	Characteristic Wavelengths	Surface mineral/ chemical comp.	Apollo; Viking Landers
Ultraviolet Spectrometry	UV	Spectrum of Reflected sunlight	Atmospheric Composition: H,He,CO_2	Mariner; Pioneer; voyager
Photometry	UV, Visible	Albedo	Nature of Surface; Composition	Earth Telescopes; Pioneer
Multispectral Imagers	UV, Visible, IR	Spectral and Spatial	Surface Features; Composition	On most missions
Reflectance Spectrometers	Visible, IR	Spectral intensities of reflected solar radiation	Surface Chemistry; mineralogy; processes	Telescopes; Apollo
Laser Altimeter	Visible	Time delay between emitted and reflected pulses	Surface Relief	Apollo 15,16,17
Polarimeter	Visible	Surface Polarization	Surface Texture; Composition	Pioneer; Voyager

Infrared Radiometer (includes scanners)	Infrared	Thermal radiant intensities	Surface and atmospheric temperatures; compos.	Apollo; Mariner; Viking; Voyager
Microwave Radiometer	Microwave	Passive microwave emission	Atmosphere/Surface temperatures; structure	Mariner; Pioneer Venus
Bistatic Radar	Microwave	Surface reflection profiles	Surface Heights; roughness	Apollo 14,15,16; Viking
Imaging Radar	Microwave	Reflections from swath	Topography and roughness	Magellan; Earth systems
Lunar Sounder	Radar	Multifrequency Doppler Shifts	Surface Profiling and imaging; conductivity	Apollo 17
S-Band Transponder	Radio	Doppler shift single frequency	Gravity data	Apollo
Radio Occultation	Radio	Frequency and intensity change	Atmospheric density and pressure	Flybys and Orbiters

* Adapted from Billy P. Glass, *Introduction to Planetary Geology*, 1982, Cambridge University, Press

Hyperspectral	visible-NIR	Reflected solar radiation	Surface	Mars

Wide-field Infrared Survey Explorer (WISE) since Nov 20, 2009 .. Succeeded by NEOWISE (2013) Looking out into space
Detectors at 3.4, 4.6, 12 and 22 microns, chilled to 10 Kelvin



Hubble telescope 1990
0.1 – 0.8 microns, 535km

James Webb Space Telescope
0.6 – 28 microns, 1.5 million km
Launched Dec 25, 2021

http://www.nasa.gov/mission_pages/WISE/main/index.html

Images of Jupiter

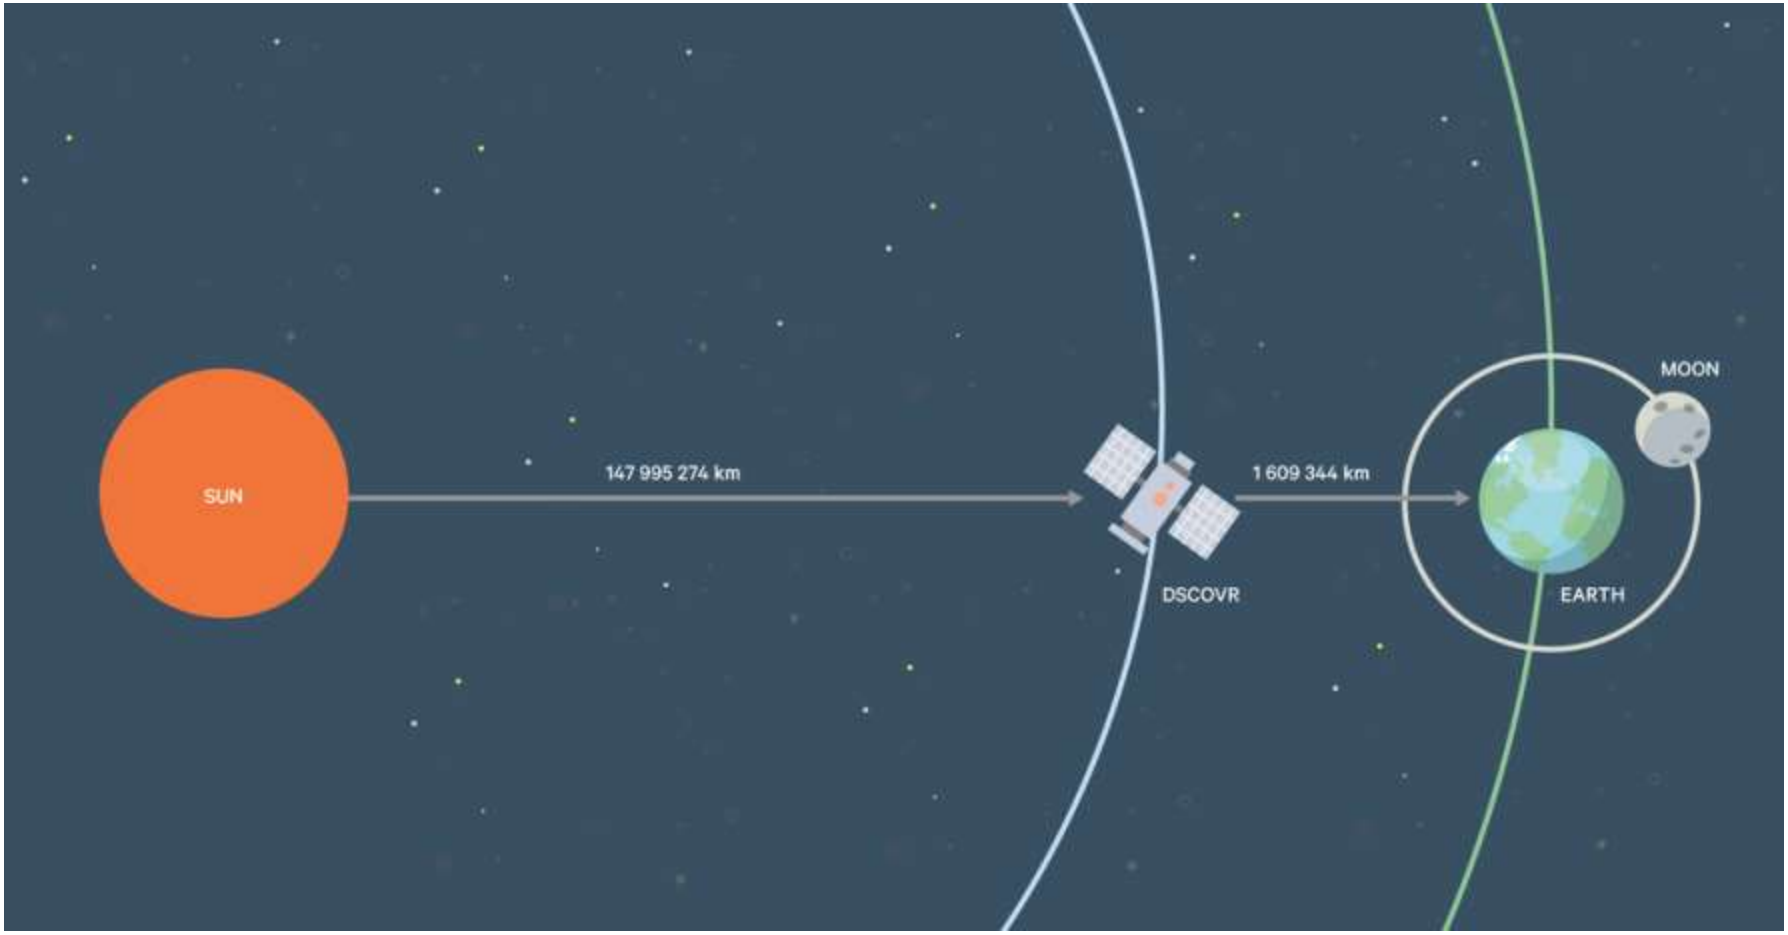
DSCOVR: Deep Space Climate Observatory - 2015
1 million miles away – ~10km resolution
– orbiting at 'Lagrange point L1 = gravitational pull



Proposed by Al Gore,1998 to study earth and solar wind
The first satellite orbiting in deep space ….. 'Goresat'

1. EPIC: Earth Polychromatic Imaging Camera, 10 bands

EPIC Wavelengths and main data products

Wavelength(nm)	Full Width (nm)	Primary Application
317.5 ± 0.1	1 ± 0.2	Ozone, SO_2
325 ± 0.1	2 ± 0.2	Ozone
340 ± 0.3	3 ± 0.6	Ozone, Aerosols
388 ± 0.3	3 ± 0.6	Aerosols, Clouds
443 ± 1	3 ± 0.6	Aerosols, Clouds
551 ± 1	3 ± 0.6	Aerosols
680 ± 0.2	3 ± 0.6	Aerosols, Vegetation
687.75 ± 0.2	0.8 ± 0.2	Aerosols, Vegetation, Clouds
764 ± 0.2	1 ± 0.2	Cloud Height
779.5 ± 0.3	2 ± 0.4	Clouds, Vegetation

2. Radiometer to measure radiance UV-TIR, - monitor earth temperature

‘Dark side’ of the Moon crossing Earth from DSCOVR satellite

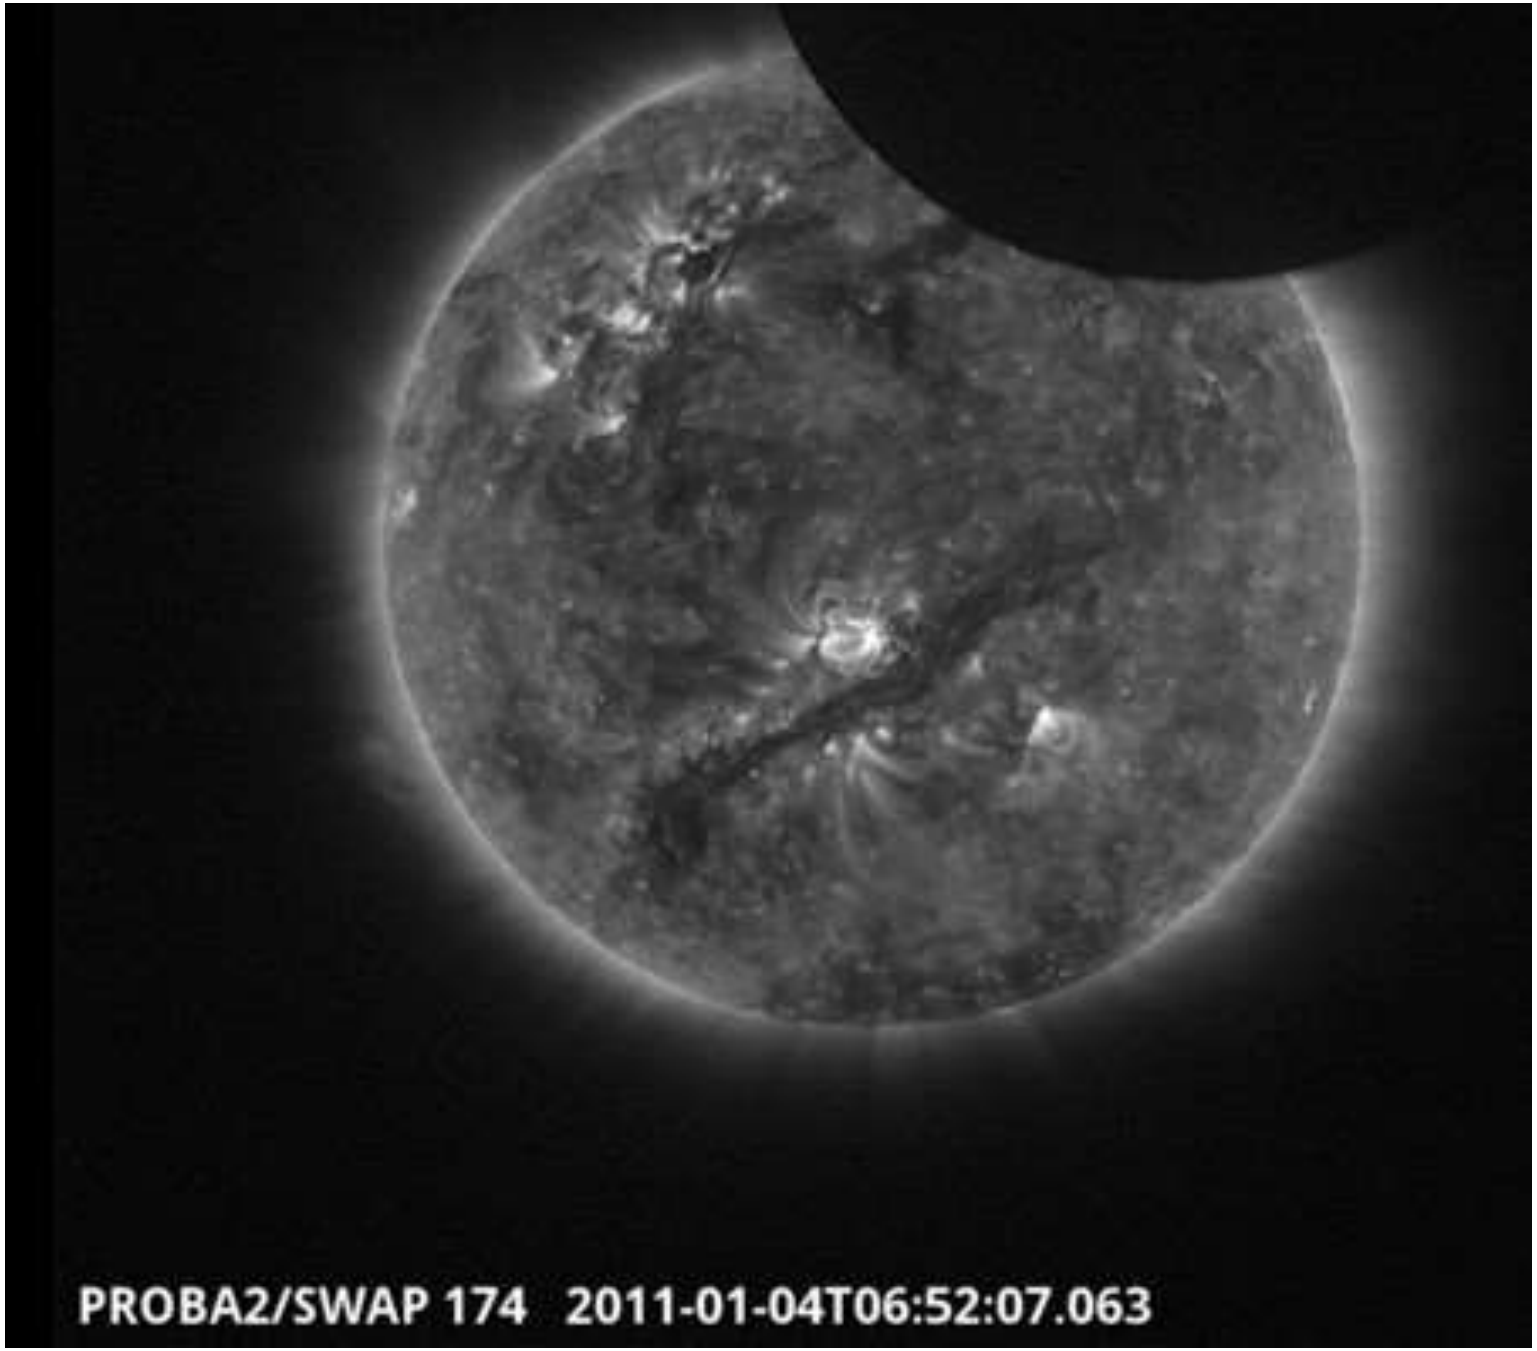
Partial solar eclipse by the Moon



Types of Remote Sensing Missions

- Fly-bys

Mariner Missions, Mercury and Venus

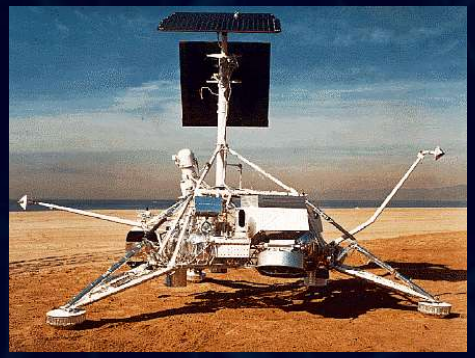
New Horizons 2007, Jupiter and Pluto

- Orbiters

LandSat, Earth

Mars Reconnaissance Orbiter

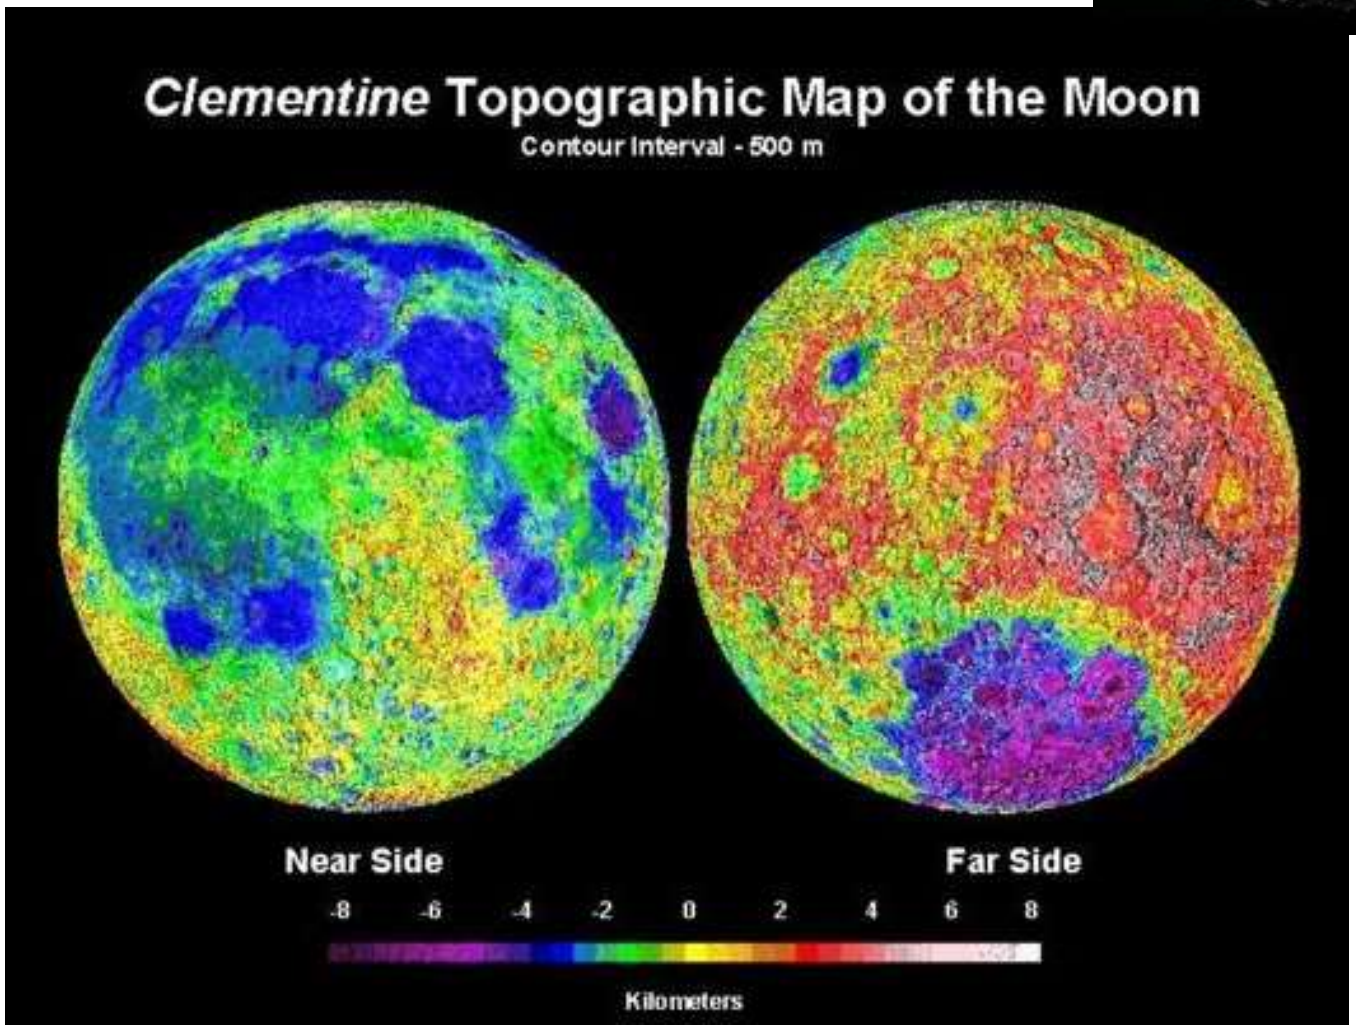
- Landers / Rovers



Surveyor Lunar Lander, 1966

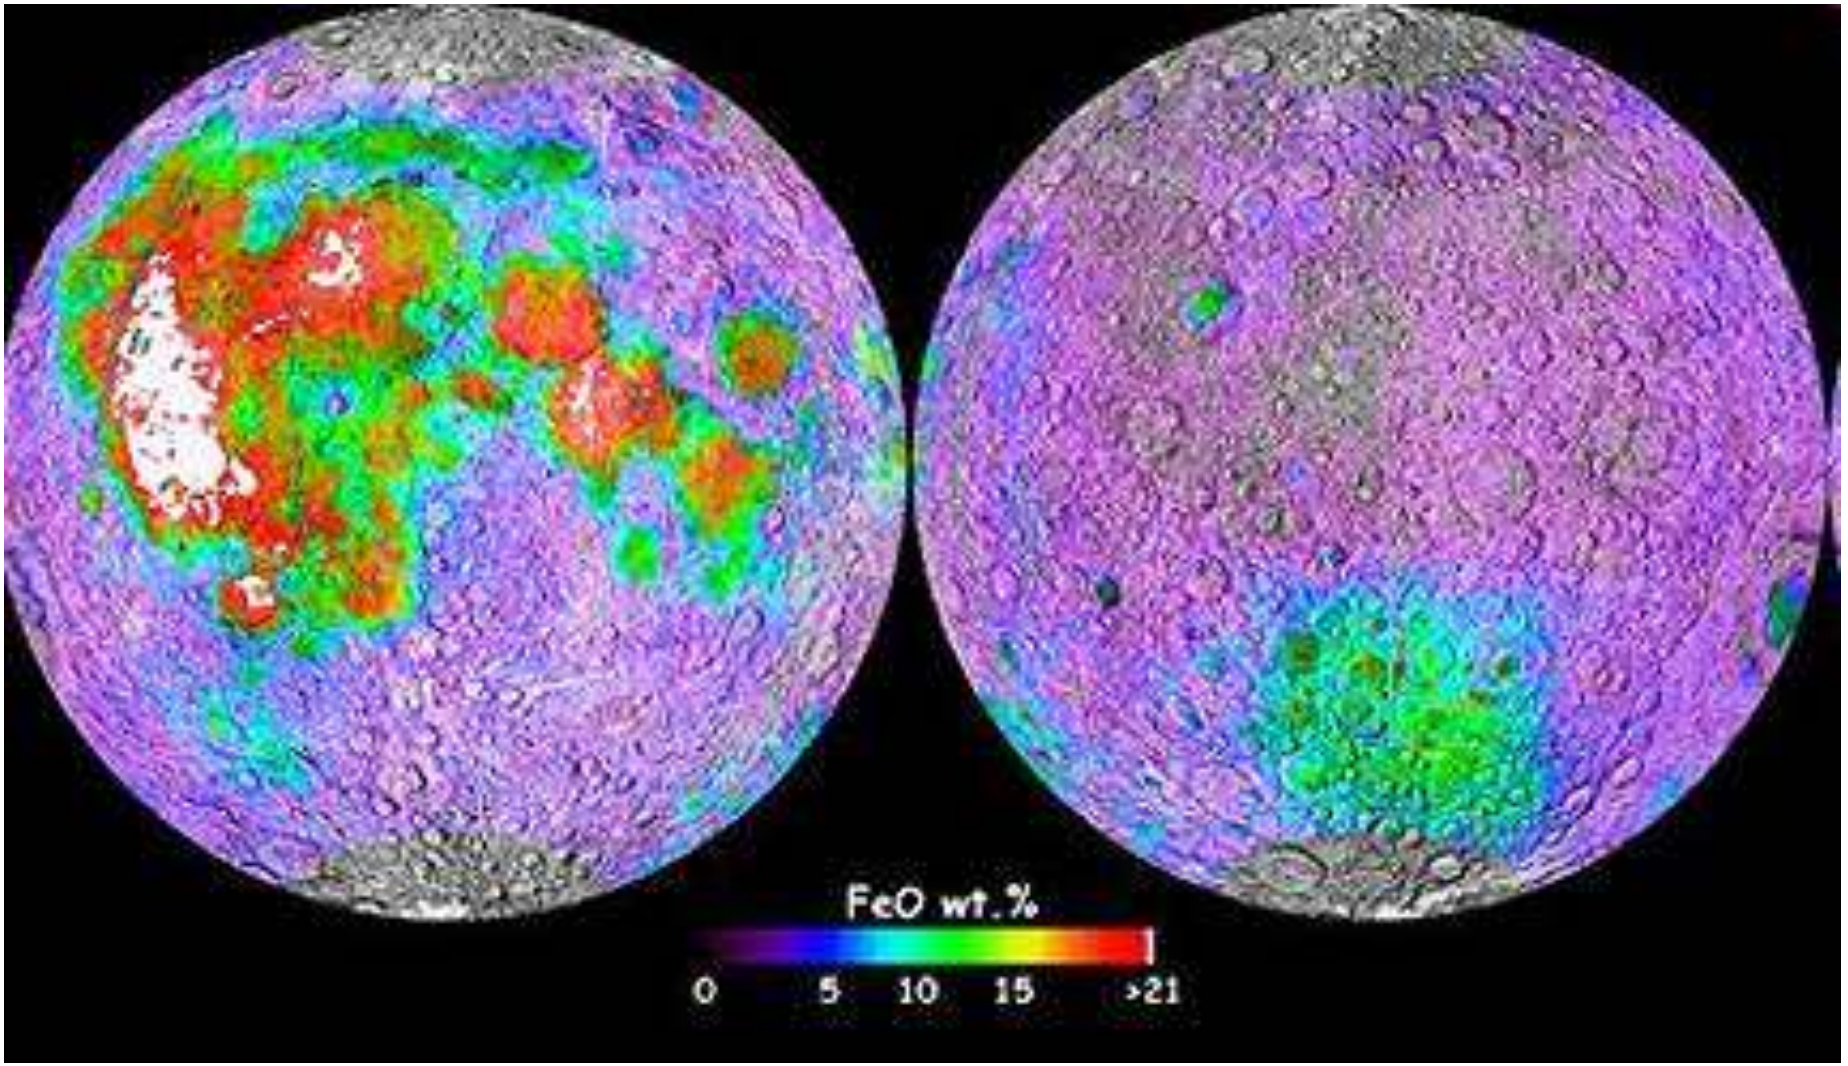
Mars Rovers, 2003

After Apollo (1972), the Moon was not revisited until an unmanned spacecraft, Clementine orbited to conduct mapping studies February 19 - April 21, 1994, using UV/Visible, Near IR, and Lidar



https://www.google.ca/moon/

specialized products include detailed maps of lunar topography and the distribution of several chemical elements, such as iron (Fe) and titanium (Ti), determined by analyzing reflectance variations at 0.75 mu and 0.95 mu, where these elements absorb radiation.

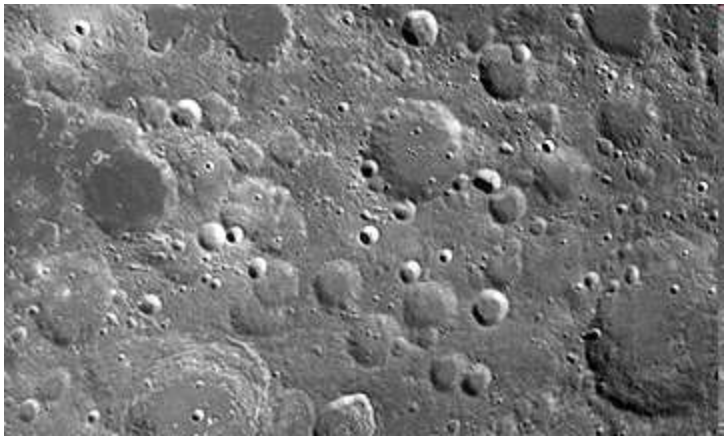


In mid-April 2000, the Terra spacecraft was turned upside down and pointed at the Moon. This ASTER image was acquired at that time, showing band 3 (NIR) in black and white.

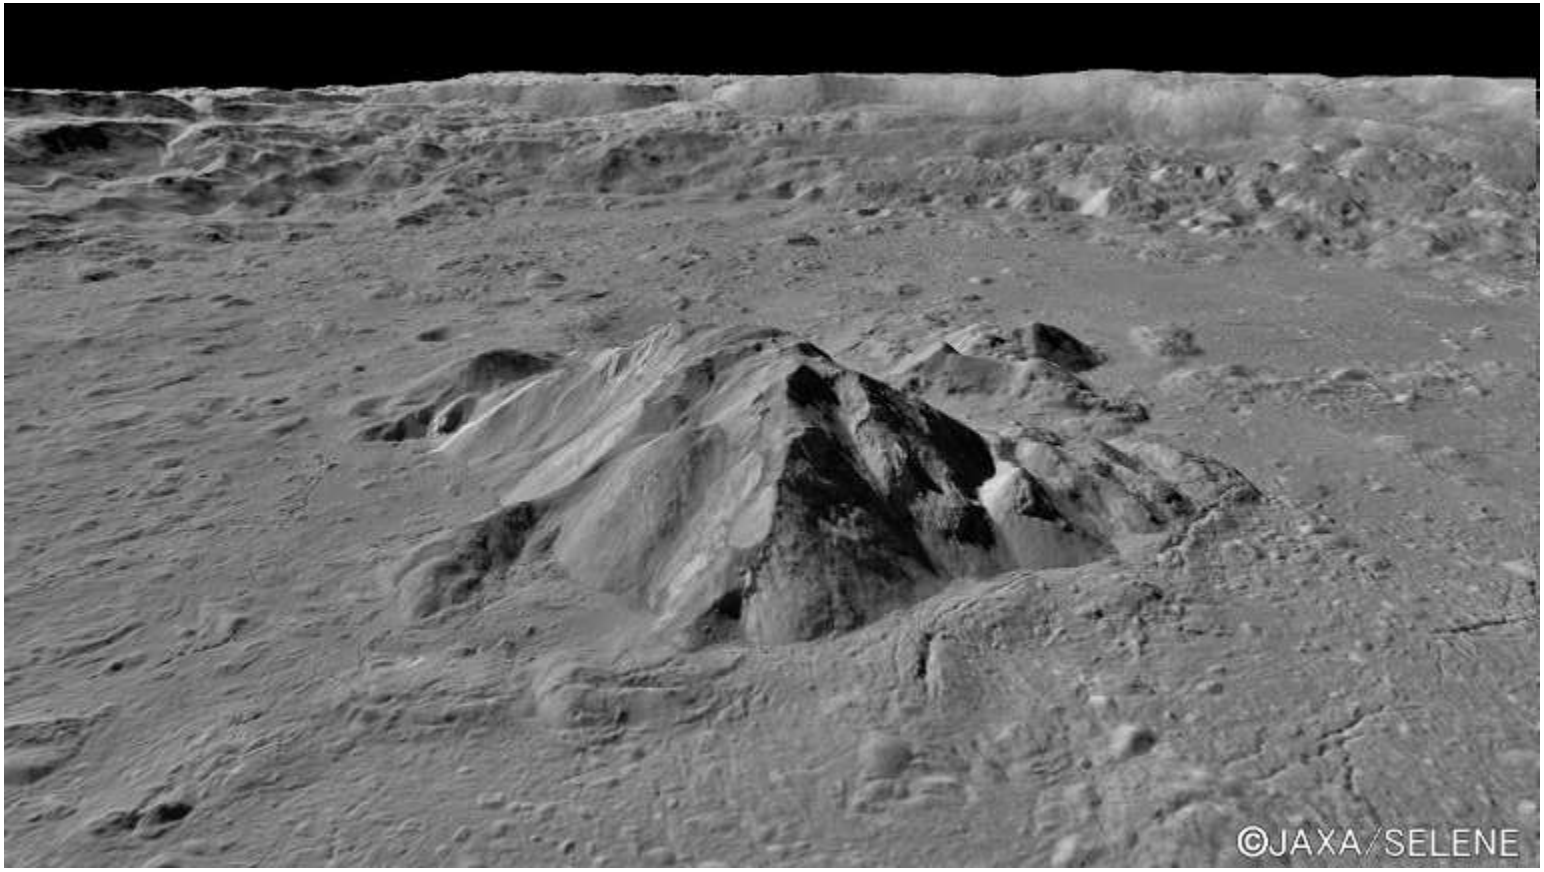
Recent Lunar missions

Right: China: Chang'e-1 (2007)

Chang'e-3 (2013) soft landed on moon



Below: Japan – Kayuga
Launched 2007, impacted on lunar surface 2009 (near South Pole)



http://photojournal.jpl.nasa.gov/index.html

Suspected rock glacier, Mars Orbiter Camera JPL/NASA

Resolution = 1m

- **MOC has produced over 250,000 images to 2020**

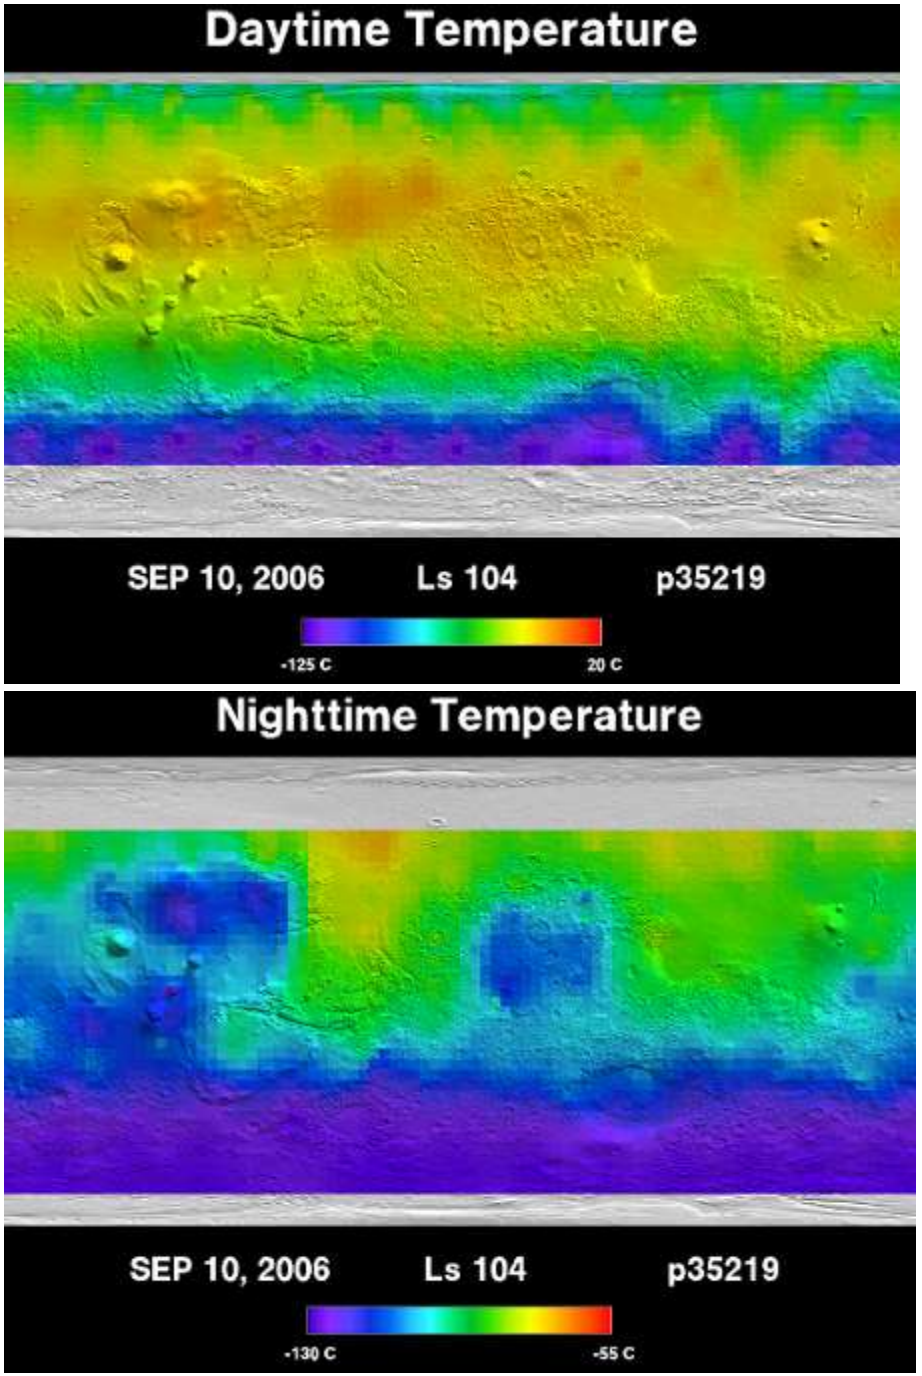
Thermal Emission Spectrometer

6 to 50 (μm),

143 bands

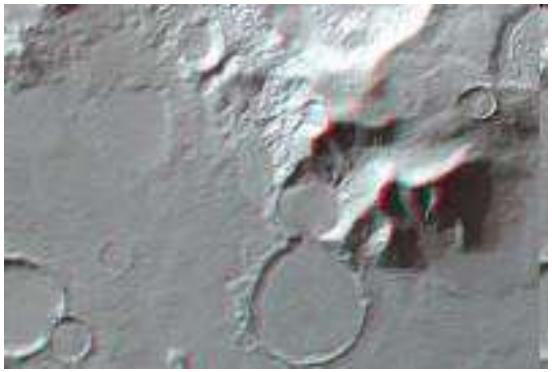
Onboard Mars Global Surveyor

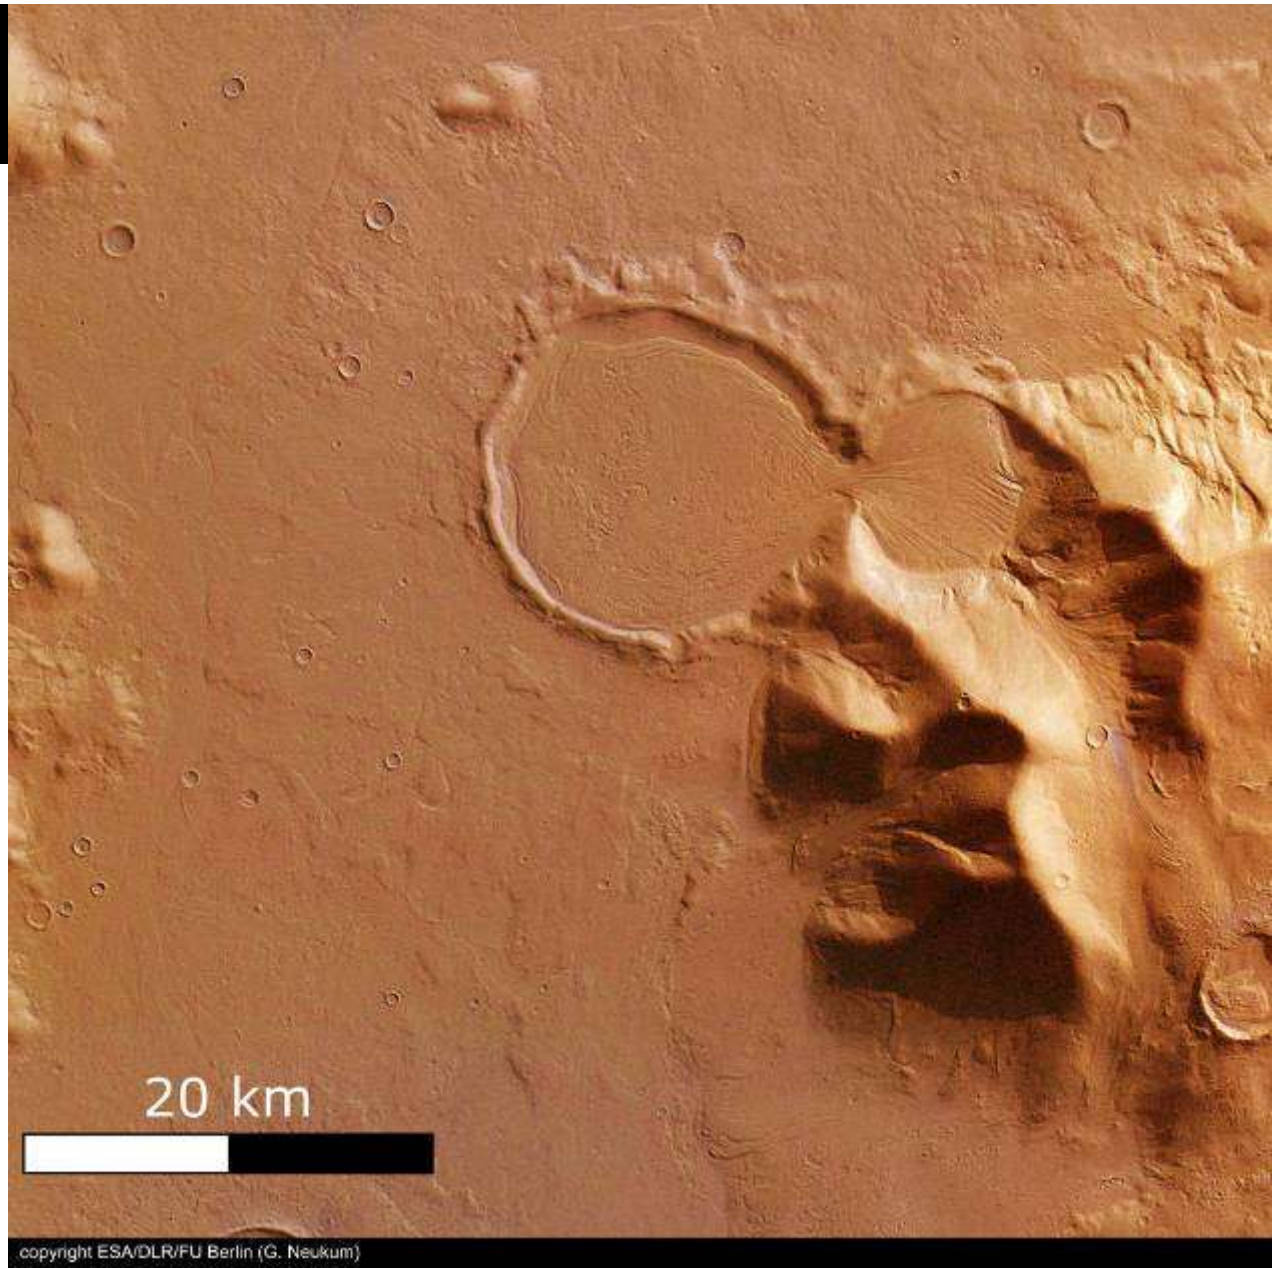
1996-2006



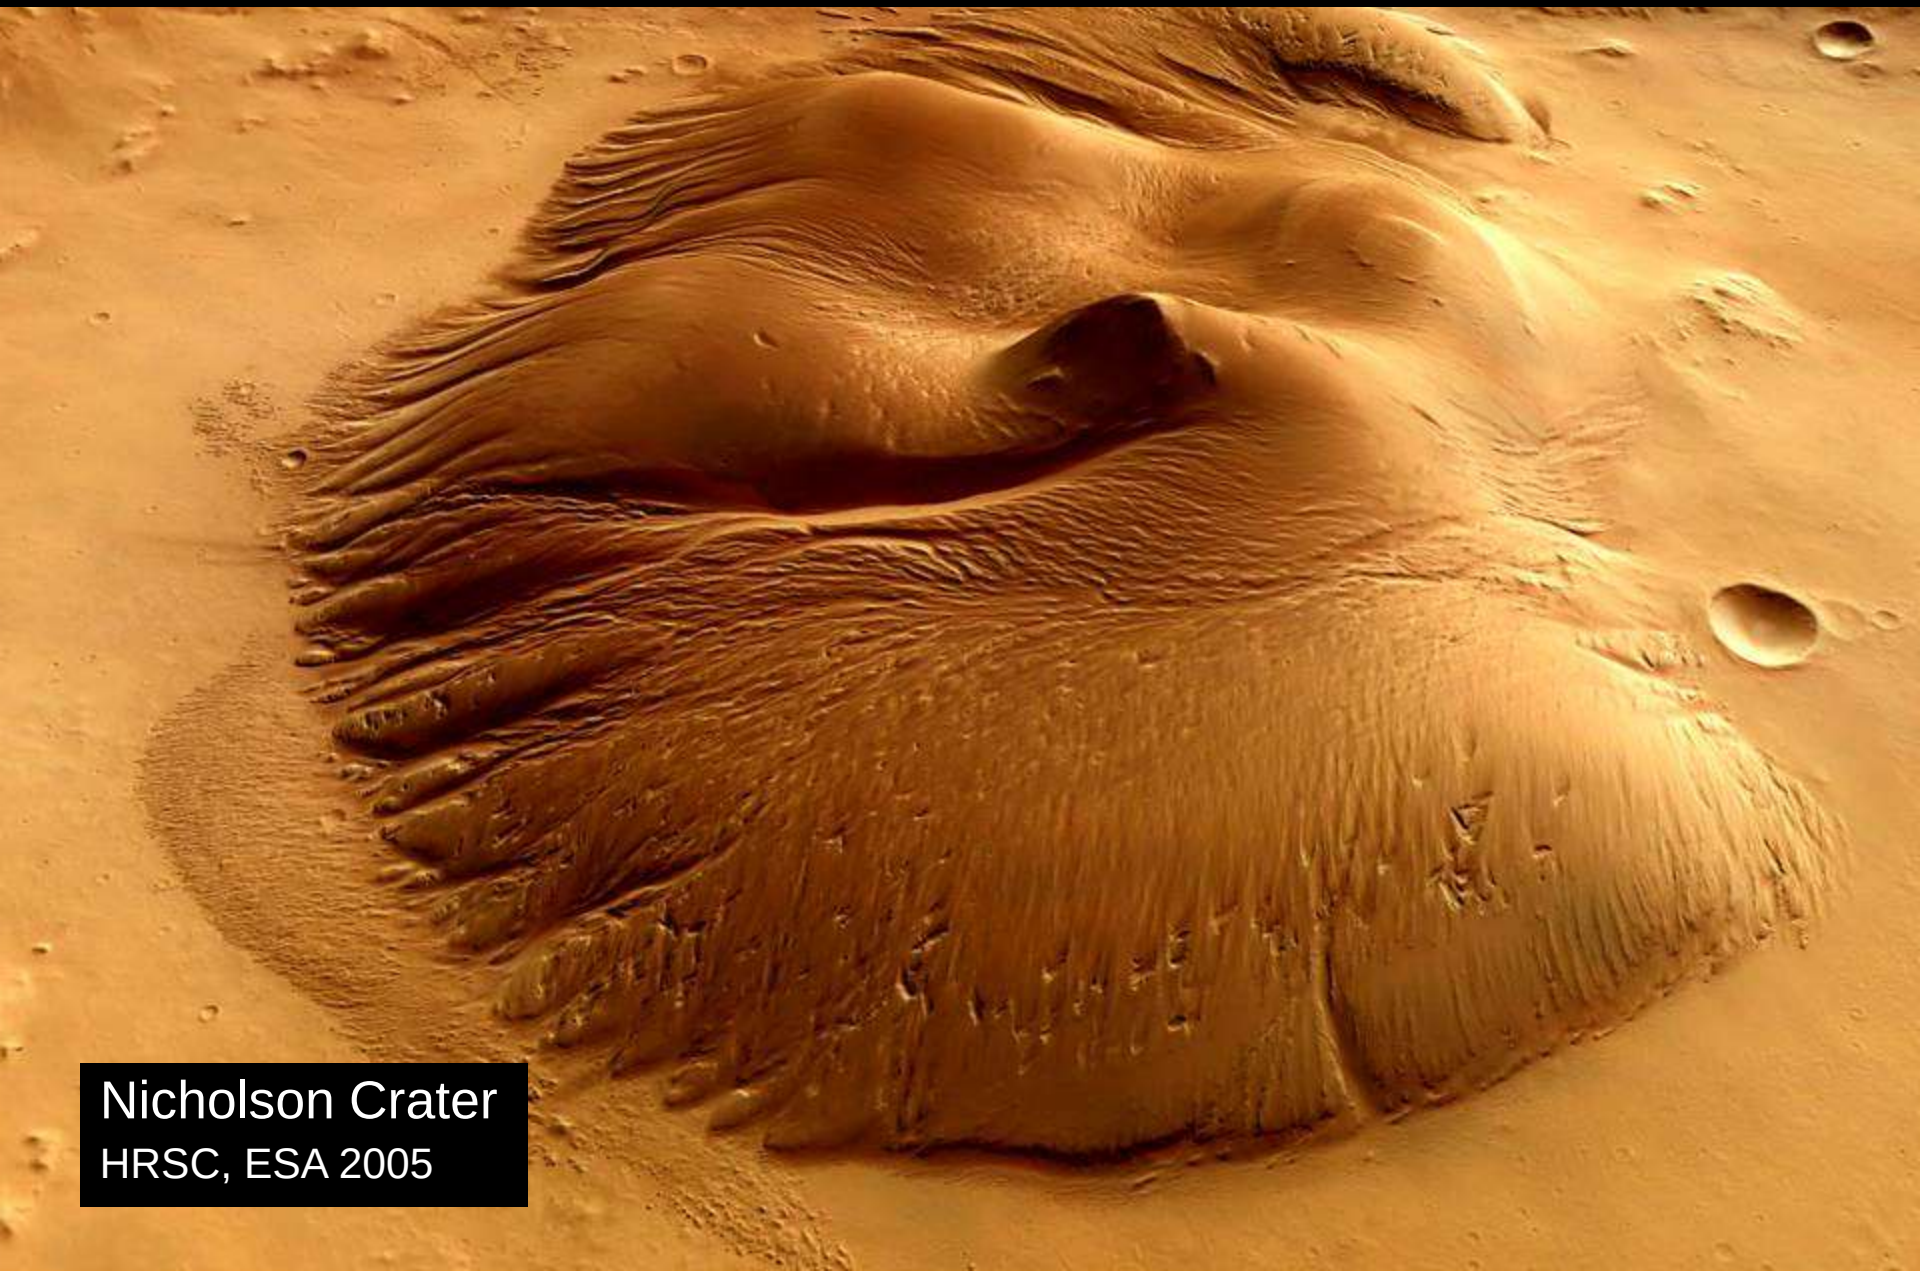
Mars Express (ESA,2003): High Resolution Stereo Camera Resolution 2-10m

The “hourglass” feature
HRSC, ESA





Mars Express: High Resolution Stereo Camera

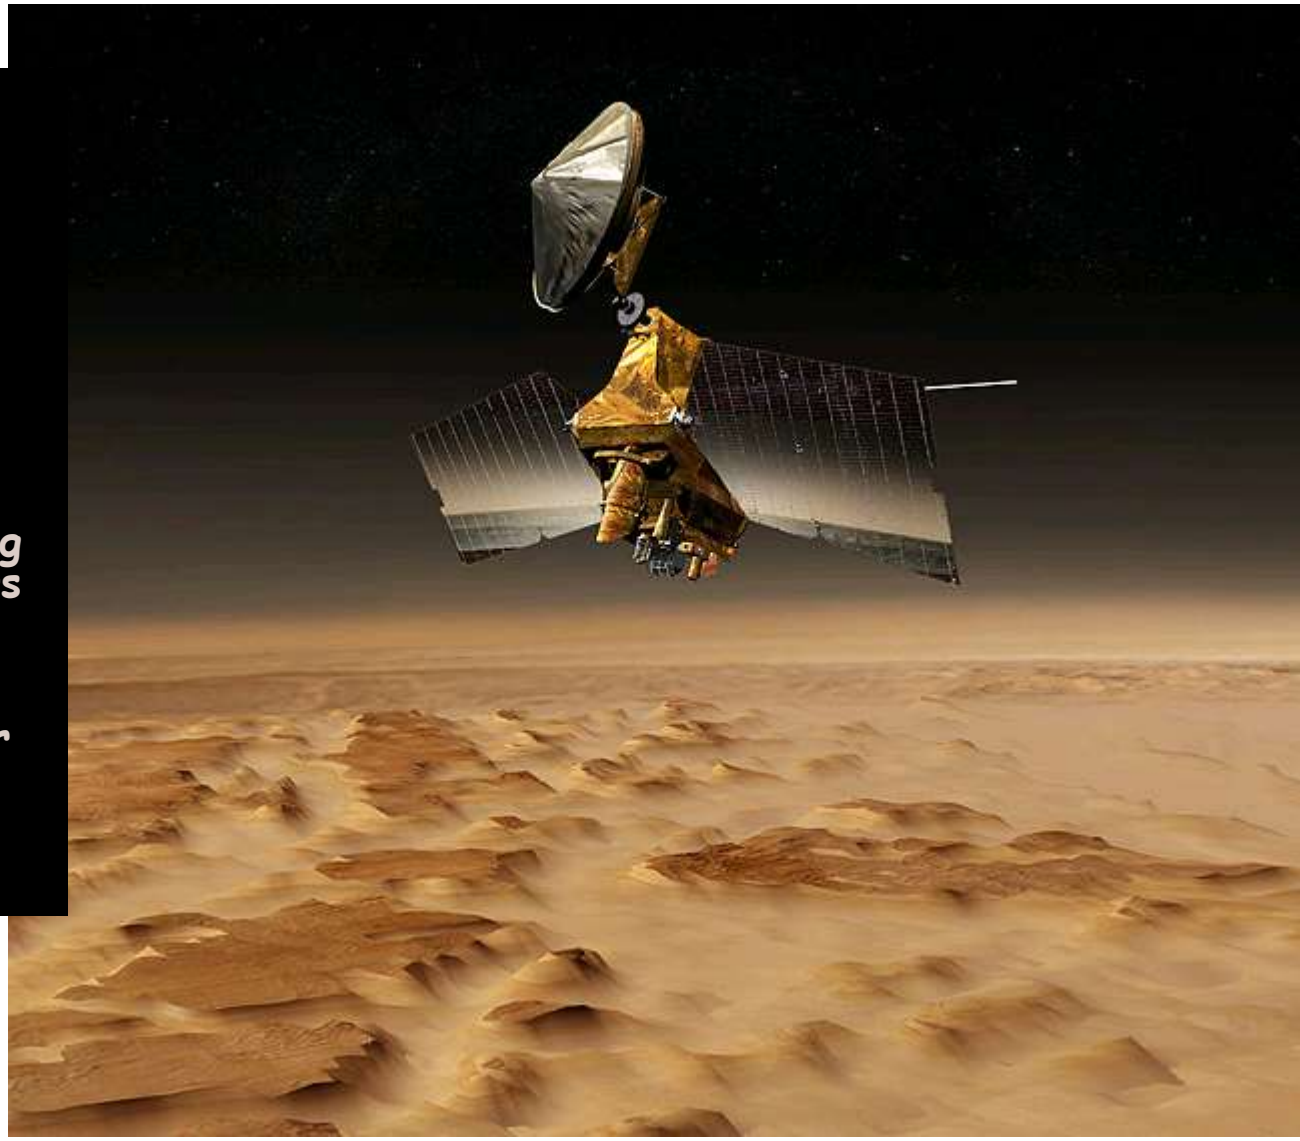


Nicholson Crater
HRSC, ESA 2005

Mars Reconnaissance Orbiter (2005)

Onboard:

- HiRISE - High Resolution Imaging Science Experiment (Visible and infrared wavelengths)
- CRISM - Compact Reconnaissance Imaging Spectrometer for Mars
- CTX - Context Imager Takes low resolution overview images for geological context



Mars Reconnaissance Orbiter: HiRISE

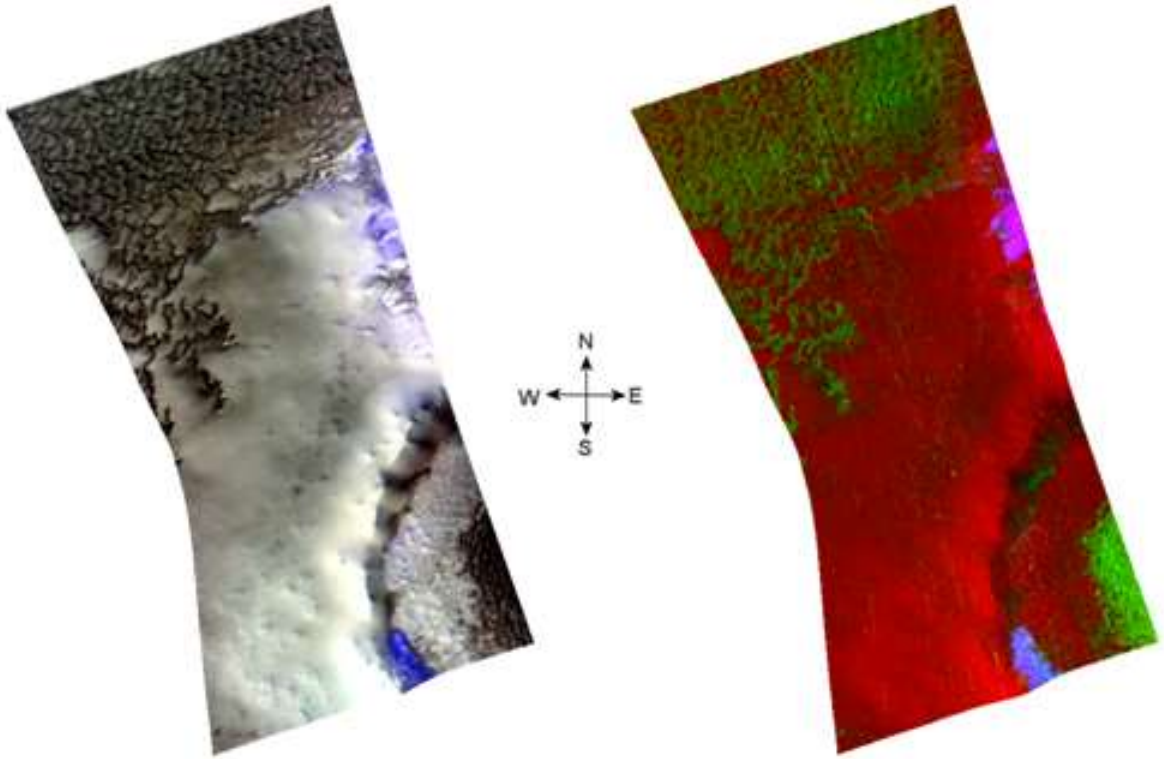
2005-

MRO HIGH RESOLUTION IMAGING SCIENCE EXPERIMENT (HIRISE) -1 foot (0.3m)
three bands, 400–600 nm (blue-green), 550–850 nm (red) 800–1,000 nm (near infrared)

http://hirise.lpl.arizona.edu/nea.php http://marsoweb.nas.nasa.gov/HiRISE/hirise_images/

Compact Reconnaissance Imaging Spectrometer for Mars (CRISM) on NASA's Mars Reconnaissance Orbiter (2005)

CRISM covers wavelengths from 0.362 to 3.92 microns (362 to 3920 nm) at 6.55 nanometers/channel, to identify a broad range of minerals on the Martian surface.



False colour infrared: Red = dust, blue = water ice

Green = polyhdrated sulphate,

Thermal Emission Imaging System (THEMIS) 2001

This is a special camera on the Mars Odyssey spacecraft (2001). Its main tasks are mapping rock mineralogies and detecting heat, which yields information on the Martian surface.

THEMIS is a multi-wavelength camera

5 visual bands:
0.425 microns, 0.540 microns, 0.654 microns, 0.749 microns, 0.860 microns

10 infrared bands:
6.78 microns (used twice), 7.93 microns, 8.56 microns, 9.35 microns,10.21 microns, 11.04 microns, 11.79 microns, 12.57 microns, 14.88 microns

Resolution:
visual images, 59 feet (18 meters) per pixel
infrared images, 328 feet (100 meters) per pixel
