## GEOG 204

## LECTURE 3 <br> Coordinate Systems

1

## Coordinate systems

- Context/Backdrop
- There is a need to know positions on the Earth's surface
- The Earth is round
- The nature of geographic information
- Paper is an important medium
- Rasters are inherently flat
- Graticule of meridians and parallels on a spheroid

## Surfaces to characterise the Earth's shape

- the Ellipsoid/Spheroid
- the Geoid (approximates earth's gravity)

- the Mean Sea Level
- Over oceans MSL = geoid; differ on landmass
- the Terrain

## Coordinate Systems

- Assuming the Earth is spherical
- Graticule of meridians and parallels on a spheroid

5

## Coordinate Systems

- A coordinate system: a reference system used to represent the locations of geographic features
- Allows geographic datasets to use common locations for integration
- Types of coordinate systems
- Geographic coordinate systems
- Projected coordinate systems

## | Geographic Coordinate Systems

- Global or spherical coordinate systems such as latitudelongitude.
- Coordinates based upon "spherical" coordinates modified to account for the imperfect shape of the earth
- The most commonly used coordinate system today is the latitude, longitude, and height system.
- The Prime Meridian and the Equator are the reference planes used to define latitude and longitude.

7

8

- Degree-Minute-Second
- $1 \mathrm{deg}=60 \mathrm{~min}$
- $1 \mathrm{~min}=60 \mathrm{sec}$
- Decimal Degrees
- $62^{\circ} 52^{\prime} 30^{\prime \prime}=62.875^{\circ}$
- Range
- Longitude: -180 to 180 (180W to 180E)
- Latitude: -90 to 90 ( 90 S to 90 N )
- "Null Island"
- GIS fails to associate coordinates to a position and instead assigns [0,0] or [Null, Null]
- A long a meridian
- $1^{\circ}=\sim 111 \mathrm{~km}, 1^{\prime \prime} \sim 2 \mathrm{~km}, 1^{\prime}=\sim 30$ metres
- It is more complicated along the parallels because they get smaller towards the pole

## \| Geographic Coordinate Systems

- A GCS includes
- an angular unit of measure,
- a prime meridian,
- a datum
- The spheroid defines the size and shape of the earth model, while the datum connects the spheroid to the earth's surface.

## Datums

- A datum
- Reference system which allows the location of latitudes and longitudes (and heights) to be identified onto the surface of the Earth
- i.e. determine the position of the spheroid relative to the center of the earth.
- GCS based on a spheroid
- The Earth is not perfectly spherical

- To project Earth to a flat plane we must choose an ellipsoid or spheroid to represent the Earth's surface.
- Choosing an ellipsoid implies selecting a horizontal datum for the projected map.
- Hundreds of datums have been created
- Reference ellipsoids are usually defined by semi-major (equatorial radius) and flattening (the relationship between equatorial and polar radii).

## Selected Reference Ellipsoids

Clarke 1866 Datum (NAD27)

World Geodetic System 1984 (North American Datum 1983 (NAD83))

| Ellipse | Semi-Major Axis <br> (meters) | 1/Flattening |
| :--- | :--- | :--- |
|  |  |  |
| Airy 1830 | 6377563.396 | 299.3249646 |
| Bessel 1841 | 6377397.155 | 299.1528128 |
| Clarke 1866 | 6378206.4 | 294.9786982 |
| Clarke 1880 | 6378249.145 | 293.465 |
| Everest 1830 | 6377276.345 | 300.8017 |
| Fischer 1960 (Mercury) | 6378166.0 | 298.3 |
| Fischer 1968 | 6378150.0 | 298.3 |
| G R S 1967 | 6378160.0 | 298.247167427 |
| G R S 1975 | 6378140.0 | 298.257 |
| G R S 1980 | 6378137.0 | 298.257222101 |
| Hough 1956 | 6378270.0 | 297.0 |
| International | 6378388.0 | 297.0 |
| Krassovsky 1940 | 6378245.0 | 298.3 |
| South American 1969 | 6378160.0 | 298.25 |
| WGS 60 | 6378165.0 | 298.3 |
| WGS 66 | 6378145.0 | 298.25 |
| WGS 72 | 6378135.0 | 298.26 |
| WGS 84 | 6378137.0 | 298.257223563 |
|  |  |  |

15

17

## Albers (conic) projection

Albers Canada: http://en.wikipedia.org/wiki/Albers_projection

19

- Straight meridians and parallels intersect at right angles. Scale is true at the equator or at two standard parallels equidistant from the equator.
- Requires:
- Standard Parallels
- Central Meridian
- Latitude of Origin
- False Easting and Northing

## Universal Transverse Mercator

- 60 slices, 60 meridians (we are in $10 \mathrm{~N}, \mathbf{1 2 6}^{\mathbf{}} \mathbf{W}$ )
- Units: Meters
- Standard for field navigation (no world maps)
- Conformal
- Key purpose: horizontal position (no $Z$ value)

UTM ZONE NUMBERS

## UTM Zones in Canada Albers

25

## Projection on the Fly

- First layer defines coordinate system
- May be changed manually (lab)
- All subsequent layers "projected on the fly"
- Same in ArcGIS, QGIS, Manifold, etc.
- Imagine displaying in 3 projections...

## Summary

- Never display in unprojected coordinates
- Local projections often the best
- Most issues/debates surround world maps
- Know the major projection shapes/classes
- UTM for horizontal position
