GEOG357: Project week 2

- Download and clip as needed – full scene, not the 3 band geotifs you used in Lab 6
- Check last lab text for best download process and conversion to .pix format
- Check that clip does not remove interesting features near the edge – go bigger if unsure
- Maybe ask me to look at your choice(s) …
- If choosing multiple scenes, carefully check they are comparable – season etc..

- Check you have all the bands you need in the clip file – they can be added back if needed
- Remember to always save new layers in the same pix file along with the bands
- Keep them all properly labelled for easy identification

- Classifications – it seems now that when you add a layer for a classification, the system will accept adding an 8-bit layer (all you need) without placing it ahead of the bands (??)
- Remember if you want to display a recent classification that is not loaded, use: layer-add-pseudocolour

- Refer back to labs if you forgot anything
- Let me know if you need DEM or more data – including vectors (next week?)

- Let me know if still thinking about area/topic/images … don't delay
- Don't accept any cloud cover unless you have to
