

# GEOG 204

LECTURE 2  
Data Collection

1

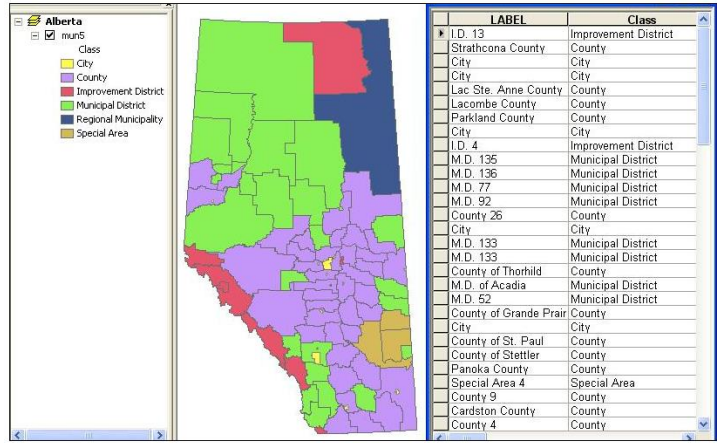

## Properties of GIS data

- *Spatial (x,y location)*  
= 'where is it?'
- *Attributes (multiple)*  
= 'what is it?'
- *[Pattern]*  
= 'how are they related?'
- *Other questions?*

2

# Location and Attributes

3

## Location and Attributes

- **x (easting), y (northing) [z-elevation] coordinates**
- e.g. latitude / longitude (degrees, minutes, seconds)

OID	X	Y
0	-79.235444	43.207055
1	-79.261247	43.191196
2	-79.205194	43.149254
3	-79.207431	43.147622
4	-79.215648	43.15465
5	-79.250881	43.164771
6	-79.253902	43.170664
7	-79.267453	43.155617
8	-79.2638	43.16129
9	-79.21237	43.139409
10	-79.244187	43.12796
11	-79.196958	43.134143
12	-79.212195	43.132831
13	-79.279129	43.170963

Coordinates: 1,8  
3,12  
8,10  
14,5  
5,1,5  
1,8

	162			0		0	0	0	0	0			0	0	
	393		Hw	60	HM	20	9	3	8.5	5	H	L	1980	1999	R
	165		HM	80	BL	20	9	3	7	4	H	L	1980	1999	R

## Location and Attributes

- **Attribute data: allows us to ask the question ... "what is it?"**
  - > Every layer has an associated table
  - > These are linked to spatial location by a code number
  - Attributes are stored in columns as *items*
  - Rows display the attributes for each feature = *records*
  - Entries may be text strings, integers, float (decimal) or dates

5

### Types of questions a GIS can answer - resulting from spatial location, attributes and patterns

- Location: WHAT exists here**  
"What is at this location?" e.g. Dig safe?
- Condition: WHERE are specific conditions**  
Where are all the pine dominated stands?
- Trends: WHAT HAS CHANGED (over time)**  
How far has the riverbank receded in the past 10 years?
- Patterns: HOW are features related**  
"How does proximity to salmon streams affect the number of bear attacks";
- Modelling: WHAT IF ..?**  
What if the climate warmed by 2 degrees?(e.g. effect on habitats)

6

## Data Collection

- A GIS can contain a wide variety of geographic data types originating from many diverse sources
  - It is an important requirement for a GIS to integrate data from many forms of data from a diversity of sources
- Data collection is time consuming and expensive
  - In some cases costs are estimated to be 85% of the cost of a GIS (Longley et al)

7

7

## Data Collection Classification

- Data collection can be classified by source
  - Primary Sources
    - captured by direct measurement specifically for use in GI systems
    - both raster and vector data can come from primary sources
  - Secondary Sources
    - reused from earlier studies or obtained from other systems
    - raster and vector data are created from maps, photographs, and other hardcopy documents

8

8

# Data Collection Classification

	Raster	Vector
<b>Primary</b>	Digital satellite remote-sensing images Digital aerial photographs	GPS measurements Field survey measurements
<b>Secondary</b>	Scanned maps or photographs Digital elevation models from topographic map contours	Topographic maps Toponymy (place-name) databases

Longley, Goodchild, et al (2015) Geographic Information Science and Systems. John Wiley and Sons

9

9

# Primary Data Collection

- Raster data
  - Data are collected by remote sensing
    - Remote sensing is the measurement of physical, chemical, and biological properties of objects without direct contact
  - Information is derived from measurements of the amount of electromagnetic radiation reflected, emitted, or scattered from objects.
    - Passive sensors rely on reflected solar radiation or emitted terrestrial radiation
    - active sensors (such as synthetic aperture radar) generate their own source of electromagnetic radiation
    - Sensors are mounted on earth-orbiting satellites or other airborne platforms

10

10

## Primary Data Collection

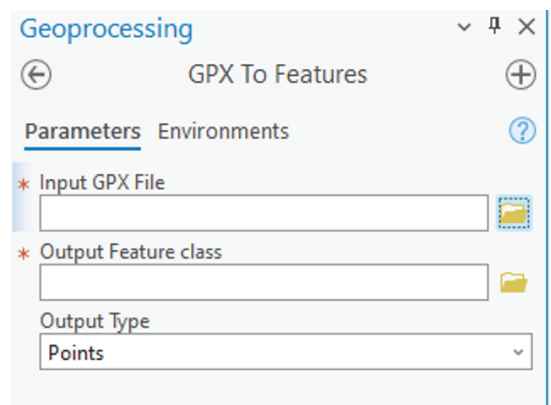

- Vector data
  - Data are captured by ground surveying, GPS and LiDAR
  - Ground surveying is based on the principle that the location of any point can be determined by measuring angles and distances from other known points.
    - It is highly accurate but time consuming and expensive
  - The GPS consists of a system of 24 satellites each orbiting the Earth every 12 hours and transmitting radio pulses at precisely timed intervals
    - A receiver on the ground must make exact calculations from the signals, the known positions of the satellites, and the velocity of light in order to determine its position
    - GPS was developed by the US. Russia has GLONASS; China has BEIDU; Europe has GALILEO

11

11

## GPX File Conversion

- GPX is a standard GPS file format
- QGIS reads it directly
- ArcGIS has one intermediate step
  - Analysis > Tools > Geoprocessing > GPX to Features
  - Input from GPS, output to shapefile

12

## Primary Data Collection

- Vector data
  - Data are captured by ground surveying, GPS and LiDAR
  - LiDAR (light detection and ranging) employs a scanning laser range finder to collect accurate data
    - A LiDAR scanner is an active remote sensing instrument
    - It transmits electromagnetic radiation and measures the radiation that is scattered back to a receiver after interacting with the objects on the surface
    - The data collected from a LiDAR scanner is often referred to as a point cloud - a massive collection of independent points with (x, y, z)

13

13

## Secondary Data Collection

- Raster Data Capture
  - Scanners
    - A scanner is a device that converts hardcopy media into digital images
    - Documents, such as building plans, CAD drawings, property deeds, and equipment photographs are scanned to reduce wear and tear, to improve access, to provide integrated database storage, and to index them geographically (e.g., building plans can be attached to building objects in geographic space).
    - Film and paper maps, aerial photographs, and images are scanned and georeferenced so that they provide geographic context for vector data layers
    - Maps, aerial photographs, and images are scanned prior to vectorization and sometimes as a prelude to spatial analysis

14

14

## Scanners and Cameras

- High resolution raster

Contex

<http://www.library.unt.edu/digital-projects-unit/scanners-and-scanning-systems>

15

## Secondary Data Collection

- Vector Data Capture
  - The digitization of vector objects from maps and other geographic data sources by heads-up digitizing and vectorization, photogrammetry, and COGO data entry
  - Heads-up digitizing and vectorization
    - creates vectors selectively from raster data
    - digitize vector objects manually straight off a computer screen using a mouse or digitizing cursor.
      - **heads-up digitizing** because the map is vertical and can be viewed without bending the head down.
    - Used to collect data for land parcels, buildings, and utility assets....

16

16

# Vector Data from Historic datasets and Maps

17

## Vector Data from Historic datasets and Maps

- Digitizing centuries of hand-drawn maps...
- Guess who got to do this job??
  - Prisoners
  - GIS Techs
  - Students!
- Tedious and Painstaking

18

## Digitizing

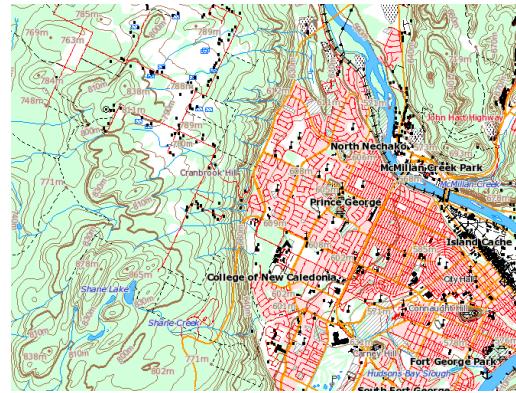

Digitizing is done in two ways:

Tracing lines on maps initially using a tablet with map taped down,

or

onscreen / 'heads-up' (= copying a map) after 1995

CONNECT  
THE DOTS

19

## Digitizing Procedure

- Lines = connected points
  - Manual point selection
  - Timed point selection
  - Interval point selection

<http://forum.imagej.net/v/digitizing-contour-map/118>

20

## Simplifying Lines

- Each vertex has a storage cost
- How much is enough? Too many?
- If too many, simplify in post process
  - Point remove: maintain essential shape
  - Bend simplify: maintain "important" bends

<http://pro.arcgis.com/en/pro-app/tool-reference/cartography/how-simplify-line-works.htm>

21

## Automatic Feature Recognition

- ArcScan toolbar in ArcMap
  - Automated, semi-automated, or manual modes
  - Scanned image must be georeferenced
  - Toolbar: 

22

## Digitising - editing is still needed: updates and errors

Coordinate locations are based on underlying georeferencing e.g. NAD 1983

Edits: e.g. adding new features, modifying existing features, creating a new layer

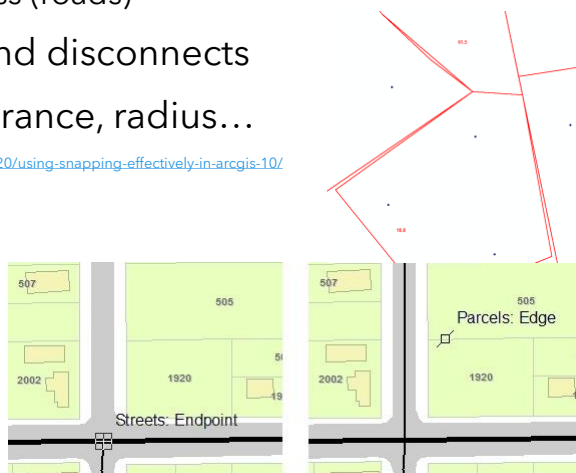

ArcEdit: <https://www.youtube.com/watch?v=6dY3x-5qX6U>

23

## Snapping

- Automatic connection to other features
  - Any features, selected features, feature class
  - Same feature class (roads)
- Prevents slivers and disconnects
- User-defined tolerance, radius...

• <https://blogs.esri.com/esri/arcgis/2010/09/20/using-snapping-effectively-in-arcgis-10/>

24

## Digitizing errors

- Common errors
  - Dangles
  - Switchbacks
  - Knots
  - Loops
  - Overshoots
  - Undershoots
  - Slivers

Source: Caitlin Dempsey, GIS Lounge

25

25

## Sources of Error

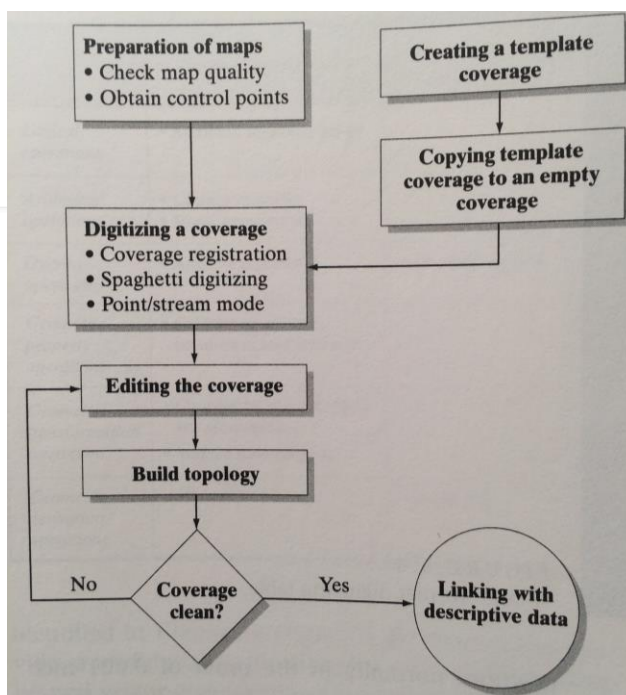

- Precision:
  - If points +/- 25m on creation
    - Similarly +/- 25m error introduced on digitization
    - Conceivably 50m total error
- Accuracy:
  - Paper may have shrunk, stretched or torn
  - Symbols rearranged to prevent overlap
  - Map sheet boundaries
  - Human boredom, fatigue, humor or malice

26

## Input Error

- Very susceptible to errors
  - Does not cause error messages in digitization process
  - Outlier analysis sometimes catches mistakes
  - Easily goes unnoticed until publication

27

**Coverage:** A layer that can contain points, lines and polygons

28

28

## Secondary Data Collection

- Vector Data Capture
  - Photogrammetry
    - Measurements are taken from pictures, aerial photographs, and images
    - Measurements are captured from overlapping pairs of images using stereoplotters.
- COGO and Other Data Entry
  - COGO is short for coordinate geometry and a method for data entry
  - Uses bearings and distances to define each part of an object
  - The COGO system is widely used in North America to represent land records and property parcels

29

29

## Secondary Data Collection

- COGO descriptions for a road centerline and parcel boundaries adjoining the road

Source: ESRI

### Spreadsheet --> Attribute Table

Spatial reference: GPS

GPS point # = row ID # ("Join" function)

Row ID links spatial and tabular data

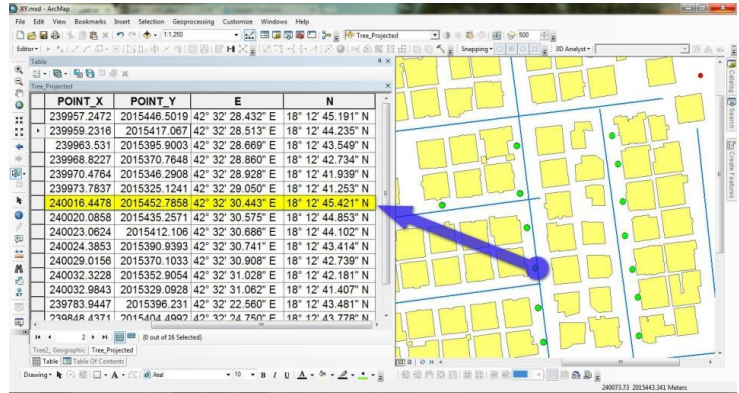

Field data usually entered in Excel or similar  
GPS data straight to Arc

32

## Keyboard Data Entry 2

- Coordinates + all data in spreadsheet
- Geographic data, no projection (unless...)

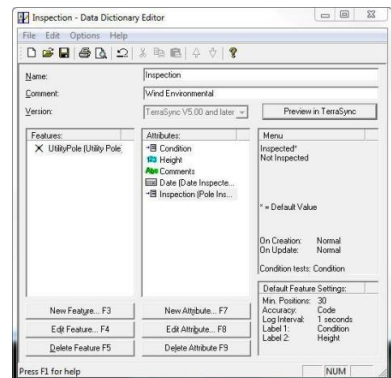

33

## Data Dictionaries (1)

- Trimble and other survey/map grade GPS
- Establish database design first
  - Features may be culverts, bridges, signs, poles...

- In this case, poles:

<http://support.windenvironmental.com/knowledgebase.php?article=104>

34

## Data Dictionaries (2)

- Populate attributes while collecting points
  - Takes ~90 seconds to average enough points
  - Data entry taken care of at no additional time cost
- Attribute table ready to use
- Requires proper prior planning

<http://support.windenvironmental.com/knowledgebase.php?article=106>

35

## Data Sources

### Canadian Sources

UNBC GIS Server (L: Drive)
